*Commissioner*

**KERALA STATE LAND USE BOARD**

Vikas Bhavan, Thiruvananthapuram-695033

e-mail : joseissac55@gmail.com

Ph: 91471 2307833 (P), 2302231, 2307830

Fax : 91471 2307838

## PREFACE

Land use planning is a process of determining suitable future action through specific and systematic evaluation of land resources, water and biomass. Kerala State Land Use Board is generating various spatial and non spatial data on natural resources management and manmade activities where we live in. This publication, Natural Resources Data Bank will provide a better understanding of the resources of the district and could be effectively used for various development and welfare activities, especially in the context of decentralized planning process.

Though may gaps are there in the publication, I hope this publication would be much helpful for, planning at microlevel

Thiruvananthapuram

## GENERAL INFORMATION

Ernakulam District is one of the most developed districts in the State. Kochi, the “Queen of Arabian Sea” is often described as the industrial and commercial capital of Kerala. This district was formed in 1958 by carving the regions from Thrissur and Kottayam district. The district comprises the area of the east while Travancore, Cochin and Malabar states. Kochi, Kanayannur, Paravoor, Aluva, Kunnathunadu, Muvattupuzha and Kothamangalam are the seven taluks of this district.

**Location:** The district is bounded by 30 Kms. Coastal belt of Arabian Sea on the West, Kottayam and Alappuzha district on the South, Idukki on the East and Thrissur on the North. It is accounted to 38 Kms, North-South and 48 Kms, East-West between  $9^{\circ} 42' 30''$  N to  $10^{\circ} 18' 00''$  N latitude and  $76^{\circ} 12' 00''$  to  $76^{\circ} 36' 00''$ E longitude.

**Area:** The area of the district accounts to 7.89% of the total area of the state with 3068 Sq .Km.

**Topography:** The district can be divided into three natural divisions - High land, Middle land and Lowland. The low land space division includes the entire Paravoor and Kochi Taluk and Western part of Kanayannur taluk. ‘Aluva, Muvattupuzha, Kothamangalam and the eastern portion of the Kanayannur taluk come under the mid land region. The major part of the Kunnathunadu taluk is in the mid land region and the remaining portion is in the high land region.

**Climate and Rainfall:** The district has a tropical humid climate with almost uniform temperature throughout the year. The average temperature has been  $30.5^{\circ}$  Celsius minimum. The district receives an annual rainfall ranging from between 250 to 360 cm.

**Rivers:** The most important rivers in the district are Periyar and Muvattupuzha. The Periyar is the longest river in the district, stretched over with a length of 244 Kms. The river plays a prominent role in the development of agricultural, industrial and commercial sector of the district. Another important river of the district is Muvattupuzha, which is formed by the union of three rivers such as Kaliyar, Thodupuzhayar and Kothamangalam.

**Backwaters:** The district is blessed with an attractive network of canals and backwaters such as Vembanad and Kodungallor Kayals stretch along the western and north eastern coast of the district and many streams and rivulets empty themselves to the backwaters. The Vembanad Kayal is a large spacious lake with a length of 82 Kms and maximum of 40 Kms. extending to an area of 205 Sq. Km.

**Forest:** The Malayattoor high range and northern and northeastern tip of the Muvattupuzha and Kothamangalam Taluk formed the forest area of the district. Area under forest is 823 Sq.Km.

**Mineral resources:** China clay noticed at Manjummel and west of Thrikkakara temple. Graphite at Peringala, Nagapuzha, Memadangu and Koothattukulam areas, Iron ore and Laterite etc., are the important mineral resource of the district.

**Soil:** Laterite soil, sandy loam and alluvial soil are the three types of soil of the district. In Muvattupuzha, Kothamangalam, Kunnathunadu and part of Aluva possess laterite soil whereas sandy loam occurs in Paravoor, Kochi and Kanayannur taluk. The alluvial soil is noticed in parts of Aluva and Kunnathunadu Taluks.

**Population:** The district ranks 3<sup>rd</sup> in the population. First being Malappuram followed by Thiruvananthapuram.

**Agriculture:** The agriculture provides a significant of employment of the district. Coconut is the principal crop grown followed by rubber, paddy and tapioca. Activities allied to agriculture such as dairy, poultry and fishery also play a very important role in the economy of the district.

**Irrigation:** 29.40% of cultivated area is irrigated in the district. Rivers like Muvattupuzha and Periyar offer ample irrigation potential.

**Electricity:** All the villages in the district are electrified. The district consumes major share of the power in the state. The Bramhapuram Diesel Power Plant and Pathalam Naphta Plant are in the district.

**Industry:** Availability of electricity, fresh water, fairly long coastline, the Kochi and Kodungalloor backwaters, good banking facility, proximity to Kochi port, presence of Kochi harbour terminal, International Air port etc are the factors which accelerated the industrial growth in the district. There are 3961 micro, small or medium

enterprises in Ernakulam District filing between 02/10/2006 and 31/03/2011. In addition to this an export-processing zone is situated at Kakkanad.

**Infrastructure:** The district has a very good transport and communication network. One of the all season ports of the country is situated at Kochi. There is one international airport at Nedumbassery; there is also one fishing harbour, which can accommodate more than thousand fishing boats. Telephone and Internet facilities are available throughout the district. The district is well connected by road, rail and air with the rest of the State and the whole country.

**Literacy and Education:** Ernakulam district is the first district in the whole country to have attained cent percent literacy by 1990.

**Economy:** Even though significant developments have taken place in industrial and tertiary sectors, the district still have a large number of people engaged in agriculture and allied activities. Dense population, urbanization, land reforms, change in family systems, etc., have resulted in the fragmentation of land. Hence a shift in the economic activity from agriculture to other sectors is taking place.

### **Tourist spots:**

**Bolghatty place:** A picturesque island with a palace turned tourist hotel, which was built in 1744 by Dutch Government.

**Wellington Island:** Airport, harbour, headquarters of several Government departments are on this island.

**Museum:** Parikshith Thampuran Museum, museum of Kerala history, Hill place museum.

**Synagogue:** The jewel of Kochi's physique stands testimony to the tolerance and hospitality of local rulers of Kerala, built in 1568.

**Dutch Palace:** A Portuguese contribution to the King of Kochi in 1586, named after Dutch when they rebuilt the palace later.

**Fort Kochi:** The first foreign church in India. Vasco De Gama was buried here. Later remains were exhumed out and taken to Portugal.

**Chinese fishing Nets:** An enticing scene, became trademark of Kochi.

**Kalady:** 45 Km from Kochi, birthplace of Sankaracharya, the Hindu philosopher.

**Kodanadu:** Elephant camp under forest department.

**Bird Sanctuary:** Thattekadu

## DEMOGRAPHY

Table:- 4.1

### INDIA'S POPULATION –CENSUS 2011

Current Population of India in 2011	1,210,193,422 (1.21 billion)
Total Male Population in India	623,700,000 (623.7 million)
Total Female Population in India	586,500,000 (586.5 million)
Sex Ratio	940 females per 1,000 males
<b>Age structure</b>	
0 to 25 years	50% of India's current population
Currently, there are about 51 births in India in a minute.	
India's Population in 2001	1.02 billion
Population of India in 1947	350 million

### KEY FINDINGS OF THE CENSUS

- Population grows to 1.21 billion
- 181 million people added during 2001-11
- Growth declines to 17.64% from 21.15% during 1991-2001
- There are 623.7 million males and 586.5 million females
- India accounts for 17.5% of the world's population, China 19.4%
- First decade (with exception of 1911-1921) which saw addition of lesser people than the previous decade.
- Child sex ratio — 914 females against 1,000 males — lowest since independence
- Overall sex ratio rises by seven points — 940 females per 1,000 males

- Literacy rate goes up from 64.83% to 74.04%
- 74% people aged seven and above are literate
- 82.14% male literacy, 65.46% female literacy
- In 2001, male literacy was 75.26%, female literacy was 53.67%
- Delhi (11,297 people per square km) has the highest population density, followed by Chandigarh (9,252)
- Uttar Pradesh is the most populous state with 199 million people while Lakshadweep is the least populated at 64,429

## CENSUS OF INDIA 2011

### SUMMARY OF PROVISIONAL POPULATION FIGURES KERALA

#### RURAL – URBAN DISTRIBUTION

Census of India, 2011 is the second Census of the 21<sup>st</sup> century and 7<sup>th</sup> Census after Independence. The provisional results of 2011 show that Population of Kerala as on 1<sup>st</sup> March 2011 is 3,33,87,677 with 1,74,55,506 in Rural and 1,59,32,171 in Urban.

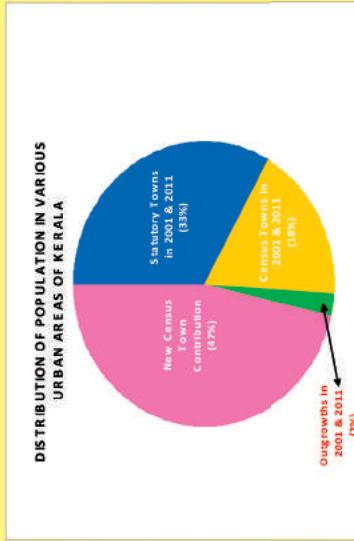

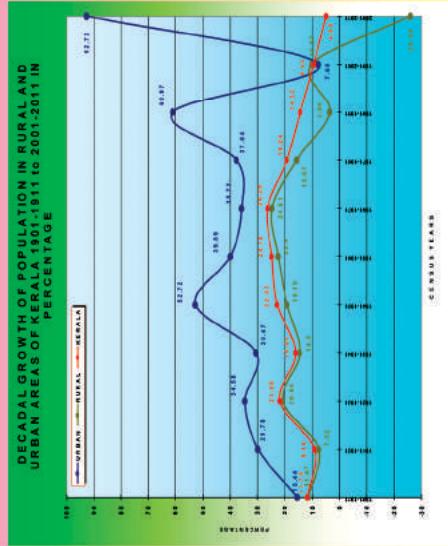

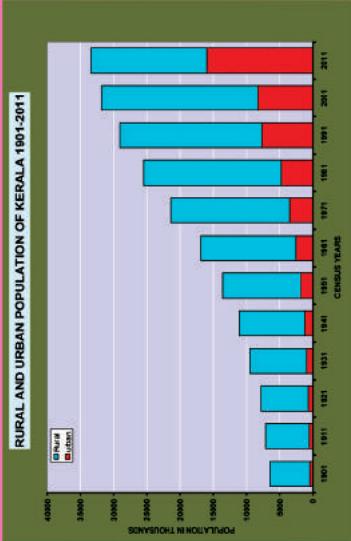

#### Our Census, Our Future

**Directorate of Census Operations, Kerala  
C.G.O. Complex, Poonkulum, Vellayani(P.O)  
Thiruvananthapuram-695 522**

**Phone:** 0471-2481859, 2481861 **Fax:** 0471-2481860

**E-mail:** [dc-o-ker.rgi@censusindia.gov.in](mailto:dc-o-ker.rgi@censusindia.gov.in)

#### Some Concepts and Definitions

##### What is census?

Population census is the total process of collecting compiling, analyzing or otherwise disseminating demographic, economic and social data pertaining, at a specific time, to all persons in a country or a well defined part of a country. As such, the census provides a snapshot of the country's population and housing at a given point of time.

**Classification of Area:**  
For Census purposes total geographical area is broadly classified into Rural and Urban.

**Urban:** Constituents of urban areas are Statutory Towns, Census Towns and Outgrowths.

**Statutory Town (ST):** All places with a municipality, corporation, cantonment board or notified town area committee etc.  
No. of STs in Kerala: 59\*

**Census Town (CT):** Places that satisfy the following criteria are termed as Census Towns (CTs). (a) A minimum population of 3000 (b) At least 75% of the male main working population engaged in non-agricultural pursuits (c) A density of population of at least 400 per sq.km  
No. of CTs in Kerala: 461 \*

**Out Growth (OG):** Out Growth should be a viable unit such as a village or part of a village contiguous to a statutory town and possess the urban features in terms of infrastructure and amenities such as pucca roads, electricity, taps, drainage system, education institutions, post offices, medical facilities, banks, etc. Examples of OGs are Railway colonies, University campuses, Port areas, that may come up near a city or statutory towns outside its statutory limits but within the revenue limit of a village or villages contiguous to the town or city.  
No. of OGs in Kerala: 16 \*

**Urban Agglomeration (UA):** It is a continuous urban spread constituting a town and its adjoining urban outgrowths (OGs) or two or more physically contiguous towns together and any adjoining urban out-growths of such towns.  
No. of UAs in Kerala: 19 \*

**Rural:** All areas other than urban are rural. The basic unit for rural areas is the revenue village.  
No. of Villages in Kerala: 1018 \*  
\* All administrative units are as on 31.12.2009, the date of freezing of administrative boundaries for Census.

## **GEOLOGY & GEOMORPHOLOGY**

Ernakulam is having a coastline of about 30 kms. It is bounded by the Lakshadweep sea in the west. Kottayam and Alappuzha districts in the south, Idukki in the east and Thrissur in the north. Its maximum length in an East West direction is about 48 km and the maximum width in North South direction is about 38 KM and the district has a total area of 3068 KM<sup>2</sup>. The district is situated between 9° 42'30" N to 10° 18' 00" N latitude and 76° 12' 00" to 76° 46' 00" E longitude.. The district is divided into three physiographic zones from west to east, the coastal plain, midland and highland regions. Kochi, the district headquarters is one of the major business and trade centers of Kerala.

Geologically two distinct litho units are discernible in the area. The eastern part is occupied by the hard rocks representing Precambrian metamorphosed rocks while the coastal tract in the west is covered by soft rock or the unconsolidated coastal alluvium.

### **GEOLOGY**

Major part of the district is occupied by charnockite and migmatite groups of rocks of precmbrian age. The charnockite group is composed of pyroxene granulite, magnetic quartzite and charnockite. Charnokite, which is very widely distributed, is coarse grained, granulitic and dark coloured. Pyroxene granulite and magnetic quartzite occur as linear bands. Calc- gneiss and quartzite of khondalite group are the oldest rocks of the area and they are seen as linear lensoidal bodies within the charnockites. The migmatite group includes biotite gneiss and quartzo feldspar in abundance. These older rocks are intruded by both acid (syenite) and basic (Gabbro and dolerite) intrusives. Patchy outcrops of warkallai beds, consisting of pebble bed, grit, friable sandstone and variegated clay is seen in the western part around Edapalli, Kalamasseri areas. Both the warkallai beds as well as the basement rocks are subjected to intense lateralization, which is confined to the midland region only. The coastal tract is covered by Quartenary sediments like beach sand, palaeo beach ridge deposits (sand), flood plain deposits (sand, silt, clay) and total deposits (clay, mud).

The main rock types in the district are charnockites gneisses, intrusive, laterite, grit, alluvium, beach sands and soil.

The charnockites are coarse grained granulate rocks and are generally dark colored. The foliation is not very well marked and the rock is massive. The gneisses include rocks showing well defined foliation like granite-silminate gneisses, calcic-gneisses, granite-gneiss, migmatites etc. The intrusives are of granite, pegmatite dolorite and gabbro types cutting across the gneisses and charnockites. Grits considered to be of Warkalli age (tertiary) are seen lying above the crystalline and the contact is marked by the zone of Kaolanisation. Laterites are seen as a capping over all types of rocks. Alluvium is noticed along the Nala and river channels. Beach sands are noticed all along the coast. Soil is noticed as the disintegration product of the hills and as transported material on the natural depressions.

## **PHYSIOGRAPHY**

The district has three well defined units- High lands, Midlands and Lowlands. The last two units form the major portion of the district while the high lands are restricted to the eastern and northern part of the district. In the eastern portion, the hill near Mullaringad is 1100 feet high. Near Kondimarton and 8 KM south-west of it, hills of 897' and 1008' high respectively are noticed. In the northern portion, Kurisumudi (1274'), Kattanna (1502') and Karathulimudi hills are seen. The low land lies between the backwater and sea, while the midland occupies the area in between the low land and the highland.

The main rivers in the district are Periyar and Muvattupuzha, which drain into the Arabian Sea. The Periyar flowsthrough all the taluks except Cochin. The Chalakudy flows through the northern boundary of Alwaye taluk and joins the Periyar at Alanthikara. The Muvattupuzha river is formed by the confluence of three rivers, viz. Thodupuzha kalli and Kothamangalam hence the name Muvattupuzha. During rainy season the rivers are full and the low lying areas are affected by heavy floods but in summer season they have very little water. Kodungallur Kayal and Varapuzha Kayal are seen in the northern and southern parts of the district. Major portion of Vembanad lake falls in this district. There are a number of tanks in the district for storing water in summer.

## **MINERAL RESOURCES**

The economic minerals of the district include magnetic iron ores, glass sand, limeshell, clays, graphites and building stones. Iron ores are found in isolated patches in Muvattupuzha and Kunnathunnad taluks. Glass sands occur at Eroor,

Puthiyakavu, Panangad and neighbouring places and at Palluruthy. Lime shell exploited from Varapuzha and Kodungallur lakes is used for lime burning. Extensive deposits of clay suitable for the manufacture of tiles occur in Aluva and Kanayannur taluks and they are exploited for the manufacture of tiles and bricks. Fairly good quality of china clay is found at Amballur and Mulanthuruthy. Ball clays suitable for the manufacture of stone ware occur in Irumbanam while graphite occur in certain parts of Kunnathunnad taluk. The crystalline rocks occur in many parts of the district are used for the building purposes and also as road metals.

The mineral found in the district are graphite, clay, peat and building stones. Graphite is found in association with the khondalite group of rocks. Good deposits of graphite are noticed in places like Avoli, Peringazha, Memadangu and Kuthattukulam. Iron-ore is reported from Mayalam and Nadayaram areas. The district has fairly good resource of chine clay, fire clay and tile/ brick clay also. China clay of primary origin is reported from Amballoor and other area. Good deposits of tile clay are noticed along the flood plains in Kalady, Parur and Neythodu areas. A peat horizon of .3 m thickness is reported from near Trpunitura found in association with the Quarternary sediments. Charnockite is widely quarried and used as building stones.

**GRAPHITE:-** Graphite occurs at Perungala, Nagapuzha, Memadangu and Kuthattukulam areas. Parts of Piralimattom occurrence also falls in this district. Graphite occurs in the form of lenses, veins and disseminations in the biotite gneisses. In Perungala area, it is of good flaky variety. The reserve is 36,000 tonnes with 15.34 % graphite. In Nagapuzha, the graphite zone has been traced over a length of over 1 KM. At Memadangu, the graphite is of impersistent occurrence. In Kuthattukulam the graphite zone is 30m wide and 400 m in the strike length. In the Piralimattam graphite is noticed over a strike length of 25-80 m. The reserve is 35,000 tonnes with 16.87 of graphite.

**BUILDING STONE:-** The charnockites and gneisses are quarried for building stones. The softer variety of laterite are cut into block and used as bricks. The beach and river sand is used as mixing material for constructional purposes.

## GEOMORPHOLOGY AND GEOHYDROLOGY

Like other parts of the State, this district is also divided into three physiographic zones as the coastal plain in the western part, midlands in the central part and highlands in the eastern part. The coastal plain is a low lying area, with a maximum elevation of around 10m, characterized by backwater bodies, marshy lands, sandy flats and alluvial plains, which are liable for flooding during the

monsoon. The midland region has a rolling topography with low hills and narrow valleys. The hills are generally covered with laterite or laterite soils and the valleys are alluvial. The region has very gentle to moderate slope from east to west. The eastern most part is a rugged terrain with steep sloped hills and small summits. It actually forms the foothills of the Western Ghats. Elevation of this terrain is generally more than 300m above MSL. As the area is covered by forest soil. thick forest and cultivation of cash crops like rubber and pepper can be seen in the area.

The district is endowed with good water resources as the rainfall is one of the highest in India and also two rivers Muvattupuzha and Periyar are flowing in the district. Potential aquifers occur all along the coastal alluvium, whose thickness varies from a few meters to 100m. Depth to water table is 0-3m. Ground water development in the area is mainly by means of dug wells. Laterites are the potential aquifers for groundwater. But the problem with laterites is ground water drains off immediately after the rainy season. In crystalline ground water occurs in the weathered and partly weathered, fractured and joined rocks. Bore wells dug in potential fracture zones gives high yields. There are about 55 National Hydrographic Stations in the district.

## **GEOTECHNICAL CHARACTERISTICS AND NATURAL HAZARDS**

The coastal alluvium, riverine alluvium, brown hydromorphic soils and acid saline are soft and unconsolidated material. Their compressive strength varies from 1-4 Kg/ cm<sup>2</sup>, while the laterite soil shows fairly good foundation characteristics and compressive strength ranging from 50-500 Kg/cm<sup>2</sup>. The foundation characteristic is fairly good in laterite terrain. Two major west flowing rivers viz, Muvattupuzha and Periyar are flowing in the district. Investigations are being carries out to locate irrigation project in the district on these rivers.

## PHYSIOGRAPHY

Based on the general, physical features, the district consists of three natural divisions, viz. lowland, midland and highland. The lowland region falls in Parur and Cochin taluks and western portion of Kanayannur taluk. The midland region which constitutes the central belt covers the major portion of Aluva, Kunnathunnad, Kothamangalam and Muvattupuzha taluks and eastern region of Kanayannur taluk. Hilly tract is along the eastern portion of Aluva, Kunnathunnad and Kothamangalam taluks which borders the Western Ghats. There are few outlying small hills in Aluva taluk, some of which are above 800 feet high above MSL. There are some hilly areas in Parur and Kanayannur taluk also. The terrain of Mulanthuruthy, Amballur, Edakkattuvayal, Kaipattur, Keecheri, Trikkakkara South and Trikkakkara North villages of Kanayannur taluk and south eastern border of Parur taluk are hilly, the highest ranging between 100 to 300 feet above MSL. The district has less than 90 sq. km. of area under forests which accounts for 3.53 percent of the total area of the district. The forest of this district falls under Chalakudy, Malayattur and Munnar divisions.

## SOILS

Forest or hilly soils are found in the highland region particularly in the eastern and north-eastern part of the Kothamangalam taluk, in the eastern most part of the Muvattupuzha taluk and in the north-eastern part of the Aluva taluk. It is characterised by the surface layer of organic matter derived from the forest growth and they are very rich in nitrogen but very low in phosphate content. Laterite soil is mainly concentrated in the midland region which has undulating valleys broken intermittently by isolated hills and plains. This fertile tract has also small patches of rock and black soils are found in this region. The laterite soil is formed by the weathering mainly of acidic rock under alternate wet and dry tropical condition. This soil varies in depth from 1.5 m to 3 m and may have kaolin clay beneath. This region has rich agricultural produces like paddy, tapioca, cashew, pepper, ginger, rubber, etc. Sandy soil is found in the lowland regions, vary in texture from sandy loam to pure sand and they are highly porous with low retentive capacity. They are deficient in all the major plant foods and lime. Peaty or Kari soil is found in a small stretch in Kanayannur taluk. They are clay soils with poor aeration and drainage and are characterised by deep black colour with extremely high content of organic matter and very high acidity. Coconut and paddy are extensively grown in the lowland region. These soils are subject to periodical inundation with salt water and are highly acidic in reaction.

Table: 8.1

**SOIL TYPES IN ERNAKULAM (OLD LOCAL TERMINOLOGY)**

Sl .No.	District	Type of Soil	Details of location
1	Ernakulam	Laterite soil	Muvatupuzha, Kothamangalam and part of Aluva and Kunnathunad taluks
		Sandy loam	Parur, Kochi and Kanayannur taluks
		Alluvial Soil	Parts of Aluva and Kunnathunad taluks

Table: 8.2

**SOILS IN ERNAKULAM**

Soils Mapping Unit No.	Description Major soils	Classification	
		Major Soils	Inclusions
K 01	Very deep, moderately well drained, sandy soils with moderately shallow water table on very gently sloping subdued sand dunes, with slight erosion; associated with very deep, moderately well drained, sandy soils.	Mixed, Aquic Ustipsammens Mixed, Typic Ustipsammens	Fine – loamy, mixed, typic Dystropepts Coarse-loamy, mixed Aquic Ustorthents
K 02	Very deep somewhat excessively drained, sandy soils with moderately deep water table on very gently sloping beaches, with slight erosion; associated with very deep, moderately well drained, sandy soils with moderately shallow water table.	Mixed, Typic Ustipsammens Mixed, Aquic Ustipsament	Coarse-loamy, Mixed, Aquic Ustorthents Fine, Mixed, Aeris Tropaquepts
K 04	Very deep, very poorly drained, clayey soils with shallow water table on level submerged lands, swamps and marshes; associated with very deep, very poorly drained, sulphide-rich, saline, clayey soils with very shallow water table.	Fine, Mixed Typic Tropaquepts Fine, Mixed, Typic Sulfaquents	Fine-loamy, Mixed, Typic Sulfaquents Mixed, Aquic Ustipasammens

K 05	Very deep, imperfectly drained, clayey soils with shallow water table on level lands with valleys, with slight erosion.	Fine, Mixed, Typic Dystropepts Fine, Mixed, Aeric Tropaquepts	Fine, Mixed,Typic Tropaquepts, Fine- loamy, Mixed Ustic Kanhaplohumults
K 07	Very deep, well drained, gravelly clay soils on gently sloping coastal laterities, with moderate erosion; associated with very deep, welldrained, gravelly clay soils with moderate surface gravelliness.	Clayey-skeletal, Kaolinitic, Typic Kandiustults Clayey-skeletal, Kaolinitic, Typic Kanhaplustult	Loamy-skeletal, Mixed, Ustoxic Dystropepts Clayey, Kaolinitic, Typic Kandiustults
K 08	Very deep, moderately well drained, clayey soils with moderately shallow water table in nearly level narrow valleys, with slight erosion; associated with very deep, imperfectly drained, clayey soils with moderately shallow water table on nearly level lands.	Fine, Mixed, Typic Dystropepts Fine, Mixed, Typic Tropaquepts	Clayey, Kaolinitic, Typic Kanhaplustults Fine, Mixed, Typic Ustropepts
K 09	Very deep, well drained, gravelly clay soils with moderate surface gravelliness on moderately steeply sloping laterite mounds, with moderate erosion; associated with deep, welldrained, gravelly clay soils on gentle slopes.	Clayey-skeletal, Kaolinitic, Oxic Humitropepts, Clayey-skeletal, Kaolinitic, Ustic Haplohumults	Clayey-skeletal, Kaolinitic, Ustic Kandihumults Fine- loamy, mixed, Typic Kandiustults
K 11	Very deep, well drained, gravelly clay soils on gently sloping mid land laterites with valleys of central Kerala, with moderate erosion; associated with deep, well drained, clayey soils with coherent material at 100 to 150 cm on gentle slopes.	Clayey, Kaolinitic, Ustic Kandihumults Clayey, kaolinitic, Typic Kanhaplustults	Fine, Mixed, Typic Dystropepts Clayey- skeletal, Kaolinitic, Oxic Humitropepts
K31	Very deep, welldrained, gravelly loam soils on steeply sloping medium hills with thick vegetation, with moderate erosion; associated with very deep, welldrained, clayey soils on mode rate slopes.	Fine-loamy, mixed, Ustic Humitropepts Clayey, Mixed, ustic Palehumults	Rock land Clayey, Mixed, Ustic Haplohumults

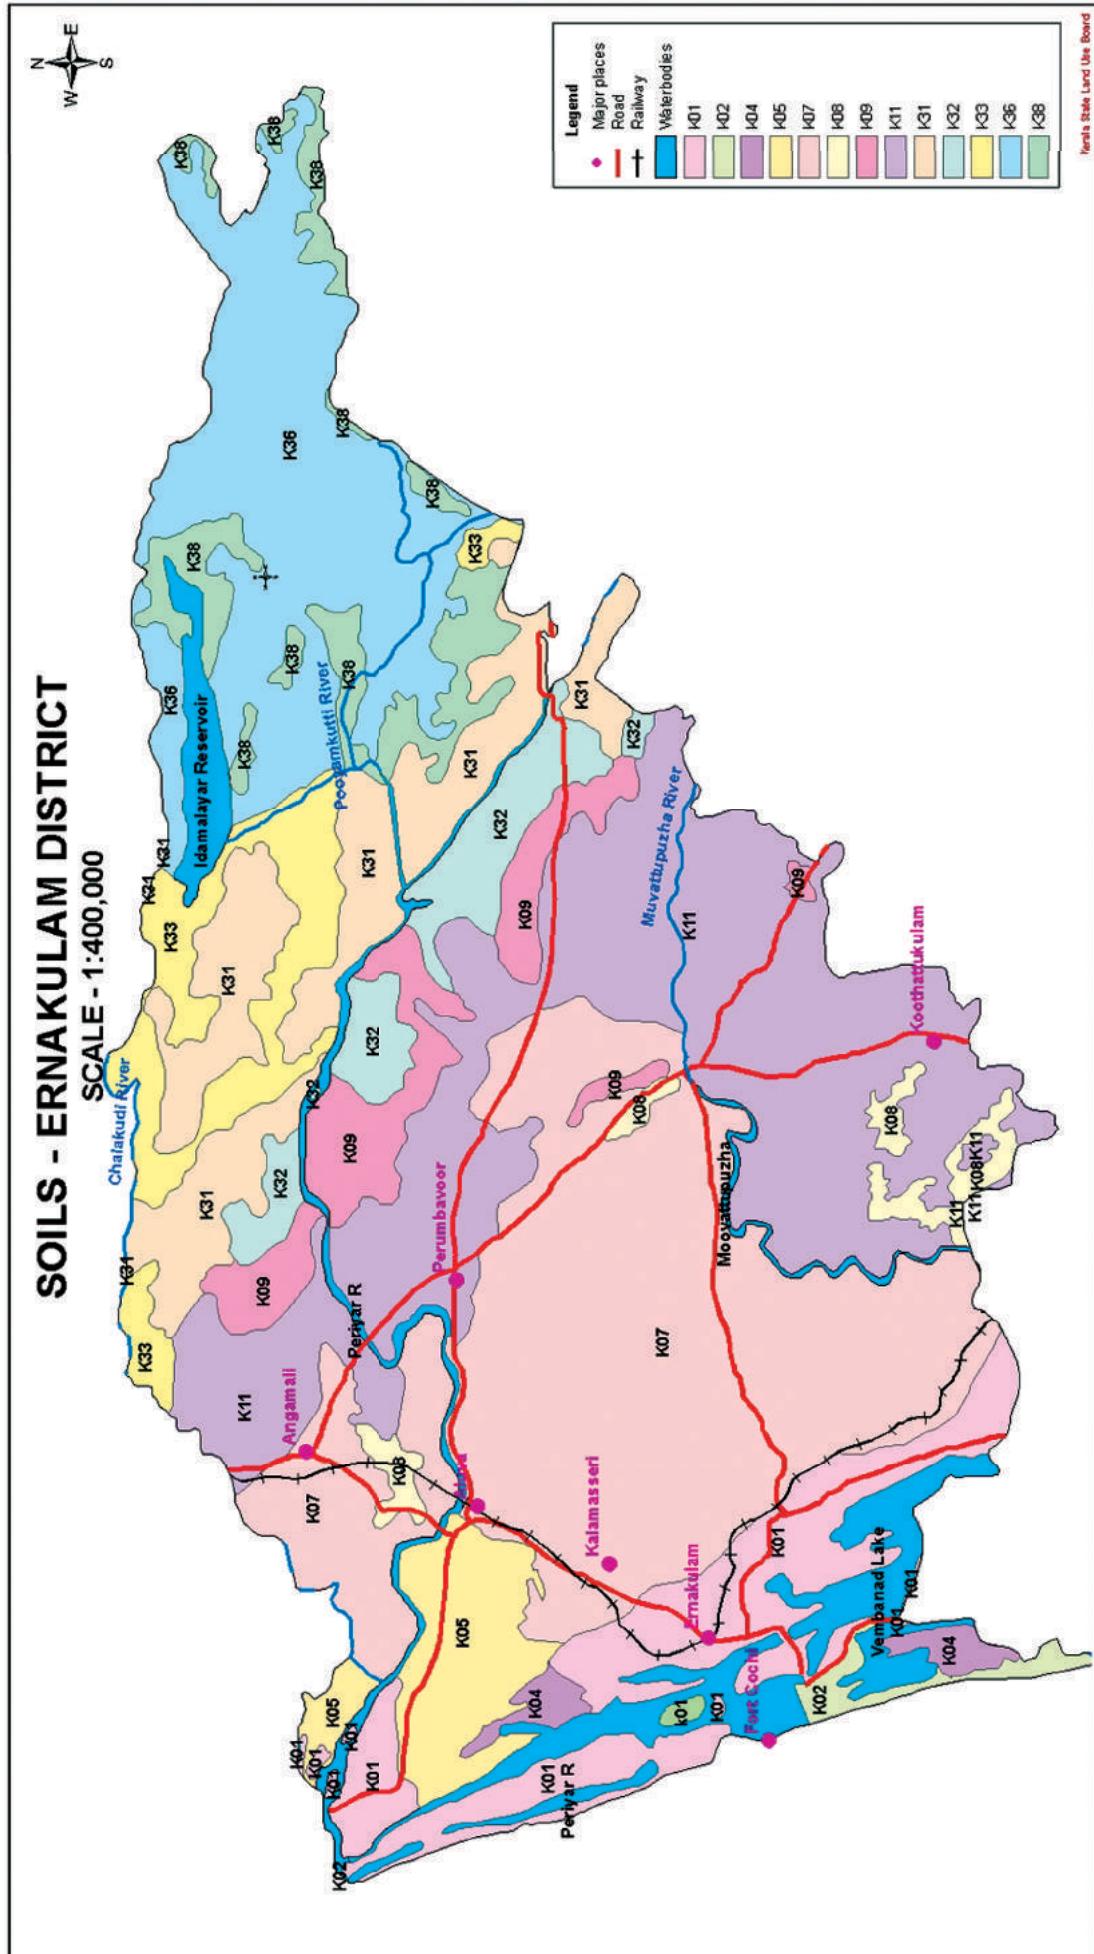

K32	Deep, Welldrained, loamy soils on gently sloping low hills with isolated hillocks, with moderate erosion; associated with deep, welldrained, loamy soils with coherent material at 100 to 150cm on moderate slopes, severely eroded.	Fine-loamy, mixed Ustic Humltropepts Fine-loamy, mixed Ustic Haplohumults	Fine, Mixed, Ustic Humitropepts Clayey-skeletal, Mixed, Ustic Humitropepts
K 33	Deep, Welldrained, gravelly clay soils on moderately sloping medium hills with thin vegetation, with severe erosion; associated with rock outcrop.	Fine, Kaolinitic Oxic Humitropepts Rock land	Fine-loamy, mixed, Ustic Palehumults
K 36	Very deep, welldrained, clayed soils on moderately steeply sloping high hills with thick vegetation, with moderate erosion; associated with deep, welldrained, gravelly loam soils on gentle slopes.	Clayey, mixed, Ustic Haplohumults Fine-loamy, mixed oxic Humitropepts	Fine mixed, Ustic Humitropepts Rock Land
K 38	Very deep, welldrained, clayey soils on moderately steeply sloping high hills with thin vegetation, with moderate erosion; associated with rock outcrops.	Clayey, mixed, Ustic Palehumults Rock land	Fine, Mixed, Ustic Humitropepts Fine-loamy, Mixed, Ustic Humitropepts

## WATER RESOURCES

In most developing countries, agriculture is the dominant user of water, accounting for more than 85% of all water use. Agriculture water use rises significant issues for water resources management like issues dealing with water scarcity, competing demands from other sectors, irrigation service delivery and system management, water use efficiencies are so forth. The primary objective in coming years will be to balance water supply and demand among users to ensure adequate water for agriculture and sustainable irrigation system management while satisfying other needs. Investments in irrigation are changing globally in response to changes in environment and experience with previous projects. In the 1970's and 1980's investment typically involved large irrigation and drainage projects with considerable infrastructure development. In the 1990's investment often supported system rehabilitation and management and more recently to small irrigation schemes. Increased water scarcity has shifted the focus from exploitation of water resources and building infrastructure to improvement of water use efficiency.

The basic premise of water resource management is that river basins are best managed and developed as an integrated whole. This is always legally and politically complex due to the challenges of allocation between users and uses. In many cases the need of river infrastructure such as weirs, dykes, regulators and other storage structures are primary drivers for adopting institutional solutions. The investment in storage structures is essential to optimize water use as well as to address the growing number of water conflicts. The surface irrigation consists of major chunk of irrigation infrastructure in the state. There are 18 dams in the state intended for irrigation. Out of this, 13 storages and 5 are barrages.

### **Live storage capacities of Irrigation Reservoirs**

The live storage position of the reservoirs during the beginning and end of the monsoon period during 2008 to 2010 are given in the following table.

Table: 9.1

(Mm<sup>3</sup>)

Sl. No.	Item	2008	2009	2010
1	Storage at the beginning of the Monsoon	452	392	531
2	Storage at the end of the Monsoon	1156	1180	1213
3	Increase due to Monsoon	704	788	682
4	Average for 10 years			
	(I) at the beginning of the monsoon	405	429	410
	(ii) at the end of the monsoon	1110	1096	1097
	(iii) increase in monsoon storage	705	667	688

## RIVERS IN ERNAKULAM

### **1. The Chalakkudy River:**

It is formed by the confluence of five streams, the Parambikulam, the Kuriarkutty, the Sholayar, the Karappara and the Anakkayam, all of them originating from the Anamalai Hills of the Western Ghats. The length of the river is 130km. and the total drainage area is 1704sq.km. Out of this 1404 sq.km lies in Kerala State and the rest 300sq.km, in Tamilnadu.

### **2. Periyar River:**

The Periyar, the longest of all the rivers in Kerala, and also the largest in potential, is formed by several streams, having their origin in the Sivagiri Group of Hills at an elevation of about +1830m above M.S.L. The length of the river from its origin to its confluence with the Arabian Sea is 244 sq. km. The river has a total drainage area of 5398 sq. km, out of which 5284 sq.km. lies within the State and the rest in Tamilnadu.

### **3. The Muvattupuzha River:**

It is formed by the confluence of three rivers the Thodupuzha, the Kaliyar and the Kothamangalam. The length of the river is 121km. The total drainage area is 1554sq.km. During its course it passes through 45 villages of the Thodupuzha, Vaikom, Kunnathunad and Kanayannur Taluks.

## ECONOMIC MINERALS IN ERNAKULAM

The Economic Minerals of the district includes magnetic iron ores, glass sand, lime shell, clays, and graphite and building stones. Iron ores are found in isolated patches in Muvattupuzha and Kunnathunad Taluks. They are of little commercial importance. Glass sand occurs at Eroor, Puthiyakavu, Panangal and neighboring places and at palluruthy. Lime shell exploited from Varappuzha and Kodungallur lakes is used for lime burning. Extensive deposits of clay suitable for the manufacture of tiles occur in Aluva and Kanayannur Taluks and they are exploited for the manufacture of tile bricks. Fairly good quantity of china clay is found at Amballur and Mulanthuruthy. Ball clays suitable for the manufacture of stoneware occur at Irumbanam while graphite occurs in certain patches of Kunnathunad Taluk. The crystalline rocks occurring in many parts of the district are used for building purpose and also as road metal.

## LAND USE

The spatial information on land use/land cover and their pattern of change is essential for planning, utilization and management of the country's land resources. Land use/land cover inventories are assuming increasing importance in various resource sectors like agriculture planning, settlement and cadastral surveys, environmental studies and operational planning based on agro-climatic zones. Information on land use/ land cover permits a better understanding of the land utilization aspects on cropping pattern, fallow land, forest and grazing land, wasteland, surface water bodies etc., which is very vital for developmental planning. Further the draft outline of the National Land Use Policy having strongly reiterated the main thrust and strategy on "Optimum Land Use Planning" for sustained efforts and economic returns, an upto date information on the nature, distribution and extent of land use/land cover will be of great relevance. Space remote sensing with its wider scope, rapid and repetitive coverage capabilities, can provide highly reliable and accurate estimate on the various resources.

Realising its importance, land use mapping on 1:250,000 scale was envisaged for the entire country using satellite data by Department of Space in 1986 as a part of Remote Sensing Application Mission Project. The study enabled to arrive at a Nationwide Land use/Land cover classification system.

Subsequently, the Government of Kerala felt the need for having an upto date information for the whole State on agriculture and other land use categories and their estimate for agro-climate zone planning in 1:50,000 scale. The work undertaken by the Board, involves preparation of land use maps on 1:50,000 scale for 14 districts through digital techniques.

The Kerala State Land Use Board was entrusted with the task of preparing the Land use/land cover maps of State, by interpretation of satellite imagery. Standard False Colour Composite (FCC) generated on 1:12,500 scale of IRS (LISS-IV) was interpreted for identification of different Land use/Land cover classes, based on the image characteristics like tone, size, shape, pattern, texture, location, association etc. by developing a detailed interpretation key for each district.

Multi-date imagery was essentially interpreted to identify and map the details of crop land in Viruppu and Mundakan seasons the area under double crop, fallow lands and for better boundary delineation of boundaries of the other land use/land cover classes. Ancillary data like topographical maps and other thematic maps of the district was also used for the interpretation.

### **METHODOLOGY**

The methodology is essentially digital interpretation of IRS-1C (LISS - IV) geo-coded image (FCC) for identification of different categories of land use/land cover using standard visual image interpretation techniques which is based on interpretation elements such as tone, texture, shape, size, etc. supplemented by the local knowledge of the interpreter. Other ancillary data like topographical maps and any other available information will be used for identification and mapping of land

use/ land cover. The interpreted details are to be verified on the ground in order to rectify the doubtful areas, and based on the ground verification, the wasteland boundaries (interpreted details) are to be finalized.

The geographical area under different land use/land cover categories was then computed and expressed as simple percentage to the total geographical area of each district.

### **Land Use/Land Cover Categories and their Spatial Distribution**

**Land use/land cover:** Land use refers to man's activities and the various use which are carried on land. Land cover refers to, "natural vegetation, water bodies, rock/soil, artificial cover and others resulting due to land transformations".

A brief description of the major land use/land cover categories observed in the different districts of the State and their spatial distribution is given below:

#### **i) Built up Land**

It is defined as an area of human habitation developed due to non-agricultural use and that which has a cover of buildings, transport, communication, utilities in association with water, vegetation and vacant lands. A total area of 241.79 Sq.km. which represent 7.909 % of total Geographical Area falls under this category.

#### **ii) Agricultural land**

It is defined as the land primarily used for farming and for production of food, fibre, other commercial and horticultural crops. It includes land under crops (irrigated and unirrigated), fallow land and plantation area under agricultural tree crops planted adopting certain agricultural management techniques. A total area of 1663.62 Sq.km. which represent 54.41 % of total Geographical Area falls under this category.

#### **iii) Forest**

It is an area (within the notified forest boundary) bearing an association predominantly of trees and other vegetation types capable of producing timber and other forest produce. This category includes Evergreen/Semi-evergreen and Deciduous forests, degraded forests where the vegetative (crown) density is less than 20% of the canopy cover, forest blanks described as openings amidst forests without any tree cover and forest plantations of trees of forestry importance and raised on notified forest lands. A total area of 727.82 Sq.km. which represent 23.80 % of total Geographical Area falls under this category.

#### **iv) Wetlands**

Wetlands are lands transitional between terrestrial and aquatic systems where the water table is usually at or near the surface or the land is covered by shallow water table. For the purposes of this classification, wetlands must have one or more of the following three attributes 1) at least periodically, the land supports predominantly hydrophytes; 2) the substrate is predominantly undrained hydric soil;

and 3) the substrate is nonsoil and is saturated with water or covered by shallow water level at some time during the growing season of each year.

#### v) Waste lands

It is described as degraded land which can be brought under vegetative cover with reasonable efforts and which is currently under utilized and land which is deteriorating due to lack of appropriate water and soil management or on account of natural causes. The two major classes in the category are; a) Land with or without scrub which occupy higher topography like uplands or high grounds with or without scrub, generally prone to degradation or erosion and b) barren rocky/ stony waste/ sheet rock area which are rock exposures of varying lithology and devoid of soil cover and vegetation. They occur amidst hill forests as opening or scattered as isolated exposures or loose fragments of boulders or as sheet rocks on plateau and plains.

#### vi) Water bodies

It is an area of improduced water, area in extent and often with a regulated flow of water,. It includes manmade reservoirs/lakes/tanks/canals, besides natural lakes, riversstreams and creeks.

The district wise area under land use/land cover categories in the State identified and mapped is furnished in Table separately.

Table showing land use/ land cover of Ernakulam district.

Table:11.1

#### LAND USE / LAND COVER CATEGORIES

No.	Category	Area (Sq. Km)	Percentage
1	Built up land (urban) - commercial	5.74	0.19
2	Built up land (urban) - beaches	5.47	0.18
3	Built up land (urban) - mixed buildup	60.46	1.98
4	Built up land (rural) - residential	20.79	0.68
5	Built up land (rural) - mixed buildup	149.33	4.88
6	Paddy - viruppu + mundakan	188.88	6.18
7	Paddy reclaimed coconut	42.13	1.38

## LANDUSE TRIPUNITHURA MUNICIPALITY ERNAKULAM DISTRICT

Kerala State Land Use Board  
Vikas Bhavan, Thiruvananthapuram-33

## BIO-DIVERSITY

The 2010 Inter National year of Bio-diversity (IYB), is a special year declared by the United Nations to help raise awareness of the importance of Bio-diversity all over the world. It is an opportunity to stress the importance of biodiversity for our well-being, reflects on our achievements to safeguard biodiversity and encourage a redoubling of our efforts to reduce the rate of biodiversity loss. The 2010 IYB is promoting some important messages. First, Humans are part of nature's rich diversity and have the power to protect or destroy. Second, biodiversity is essential for sustaining the living networks and systems that provide us all with health, wealth, food, fuel and vital services our lives depend on. Third, human activity is causing the diversity of life on earth to be lost at a greatly accelerated rate, but we can prevent this loss. Fourth, we have made some achievements to safeguard biodiversity but we need to do much more and we must act urgently. Throughout 2010 UNEP's IYB website will also feature interesting segments such as biodiversity theme of the week, examples of successful community action in biodiversity conservation and other intriguing biodiversity related components. In connection with the International year of biodiversity 2010, Kerala State Biodiversity Board has taken up several programmes.

Much of Kerala's notable biodiversity is concentrated and protected in Western Ghats. Almost a fourth of India's 10,000 plant species are found in the state. Among the almost 4,000 flowering plant species (1,272 of which are endemic to Kerala and 159 threatened) are 900 species of medicinal plants. Its 9,400 km<sup>2</sup> of forests include tropical wet evergreen and semi-evergreen forests (lower and middle elevations- 3,470 km<sup>2</sup>), tropical moist and dry deciduous forests (mid-elevations-4,100 km<sup>2</sup> and 100 km<sup>2</sup>, respectively), and montane subtropical and temperate (*shola*) forests (highest elevations-100 km<sup>2</sup>). Altogether, 24% of Kerala is forested. Two of the world's Ramsar convention listed wetland lake- Sasthamcotta and the Vembanad-Kol wetlands-are in Kerala, as well as 1455.4 km<sup>2</sup> of the vast Nilgiri Biosphere Reserve. The following table depicted the biodiversity statistics in kerala

Table: 12.1

**PLANT DIVERSITY**

Flowering Plants	4000
Grass species	350
Bamboo species	15
Reeds species	9
Orchid species	214
Gymnosperms	4
Ferns and Fern allies	200
Liverworts	200
Algae	231
Fungi	1044
Lichens	800

Table: 12.2

**ANIMAL DIVERSITY**

Large and medium sized mammals	48
General Birds species	475
Water Birds	101
Reptiles General	60
Lizard (endemic) species	30
Snake (endemic) species	57
Amphibian (endemic) species	87
Fresh water fish (endemic) species	84
Butterflies	313

## FORESTS

Kerala has a total recorded forest cover of 11309.42 sq. km which is 29.09% of the total land area of the State. This is greater than the national coverage of 19.50%. The 11309.42 sq.km of forest cover includes 9157.10 sq. km reserve forests; 214.31 sq. km proposed reserve and 1754.18 sq.km vested forest. Of the recorded forest area, the effective (actual) forest area in Kerala is only 9400 sq.km. Forests of Kerala are broadly classified into 5 major categories. They are:

<b>Sl. No.</b>	<b>Forest Type</b>	<b>Area (lakh ha.)</b>
1	Tropical Wet Evergreen Forest	3.480
2	Tropical Moist Deciduous Forests	4.100
3	Tropical Dry Deciduous Forests	0.094
4	Mountain Sub Tropical Forests	0.188
5	Plantations	1.538
<b>Total</b>		<b>9.400</b>

Much of the forest cover of Kerala is spread over the Western Ghats. The Western Ghats represents one of the world's 18 hot spots of bio-diversity and is considered to be a repository of endemic, rare and endangered flora and fauna. There are 28 vegetation types in the state, but the existence of most is doubtful. 51% of the total forest cover is in the southern districts and the remaining 49 percent is in the central and northern regions. Idukki and Pathanamthitta districts have the largest area under forest cover. Alappuzha is the only district without any area under forest cover.

Over the past years the state government had taken a number of steps towards the conservation of forest and wildlife. The state government banned clear felling of natural forest in 1983. With the aid of various organizations, including the World Bank, the government has implemented various programmes for the afforestation of degraded forests. These include Community afforestation, compensatory afforestation and general forestry programmes.

In Ernakulam District, the forest areas fall in Kothamangalam, Munnar, Malayatoor and Idukki wild Life Forest Divisions. Kothamangalam, Munnar and Idukki wild life Divisions are partly lying in the District. Under Malayattoor forest Division there were 617.2411 sq.km of reserve forest in the district. .5248sq.km area is also proposed for the reserve forest. Hence 617.7659 sq.km of forest area falls under Malayattoor Forest Division. Kothamangalam Forest division has 36.421 sq.km area in the district. 11,000 sq.km of forest area falls under Munnar forest Division. A portion of Kuttampuzha village of Kothamangalam Taluk is covered by Idukki Wild Life Division. As per village directory data the area covered by forest in the district is 664.51 sq. km.

The Integrated Afforestation and Eco-development Project(IAEDP) supported by National Afforestation and Eco Development Board under the Ministry of Environment and Forest is under implementation from 1998-99 onwards. Eco-preservation and sustainable management in selected watersheds is the ultimate objective of the scheme. Edamalayar and illithode watersheds in Ernakulam Districts are covered under this scheme.

Table: 13.1  
**Districtwise forest Area by legal Status as on  
31.03.2009(sq.km)**

### **Participatory Forest Management (PFM)**

The State has adopted Participatory Forest Management (PFM) as a Strategy for conservation of bio-diversity and for the improvement of livelihood of forest dependent people by forming partnership institutions at grass root level since 1998. The institutions in territorial forest divisions are called Vana Samrakshana samithies (VSS) Those in sanctuaries and national parks are called Eco-Development Committees (EDC). During the year 2008-09 there were 388 number of VSS'c and 189 number of EDC'c. List of the names of Vss of Kerala Forest Department in wayanad district under the management of Forest Development Agencies (FDA) are depicted in the following table...

## AGRICULTURE

Agriculture plays a crucial role in the Kerala economy. When compared to other States, the per-capita availability of cultivable land is low in Kerala. Stabilization and augmentation of productivity assume critical importance, given the limited scope for increasing area under cultivation of various crops. Increase in production would be possible mainly from improvements in productivity through the use of location specific technology and modernization of agriculture. An integrated mixed cropping pattern is practiced in the State by majority of the farmers considering the land holding size. The trends in agricultural income in Kerala during the last six years is shown in Table 1. The provisional estimate for 2009-10 indicated an increase of 0.25 per cent in growth over 2008-09.

In Ernakulam Agriculture constitutes the most important component of the District economy and it is the biggest source of employment. About 70% of the geographical area is under cultivation. Rice, coconut, lemongrass, pepper, ginger, mango, cashew nut etc; are the most important agricultural products of the District. Usually three crops of paddy are raised annually- Virippu, Mundaken and Puncha and there is another system called Pokkali, which is peculiar to the district. Under this system only one crop can be taken in a year.

## SEED RATE FOR IMPORTANT CROPS OF KERALA

1. Rice	Transplanting	-	60-85kg/ha
	Broadcasting	-	80-100kg/ha
	Dibbling	-	80-90kg/ha
2. Maize		-	20kg/ha
3. Ragi	Direct sown	-	5kg/ha
	Transplanted crop	-	4-5kg/ha
4. Sorghum		-	12-15kg/ha
5. Black gram	Pure crop	-	20kg/ha
	Mixed crop	-	6kg/ha
6. Cowpea			
1. For vegetable type			
	a. Bush	-	20-25kg/ha
	b. Trailing	-	4-5kg/ha
2. For grain and dual purpose			
	a. Broadcasting	-	60-65kg/ha
	b. Dibbling	-	50-60kg/ha
7. Green gram			
	Pure crop	-	20-25kg/ha
	Mixed crop	-	6kg/ha
8. Green pea		-	60kg/ha
9. Horse gram		-	25-30kg/ha
10. Red gram			
	Pure crop	-	15-20kg/ha
	Mixed crop	-	6-7kg/ha
11. Amorphophallus		-	9-12tonnes/ha
12. Colocasia		-	800-1200kg/ha
13. Greater yam (Kachi)		-	3000-3700kg/ha
14. Lesser yam (Nanakizhangu)		-	1800-2700kg/ha
15. Sweet potato		-	80kg tubers/ha
16. Tapioca		-	2000 stems/ha
17. Rubber		-	450-500plants/ha
18. Ground nut			
	Pure crop	-	100kg kernels/ha
	Inter crop in coconut	-	80kg kernel/ha
	Inter crop in Tapioca	-	40-50kg kernel/ha
19. Sesame		-	4-5kg/ha
20. Mango ginger		-	1500kg/ha

21. Ginger	-	1500kg/ha
22. Turmeric	-	2000-2500kg/ha
23. Betel vine	-	20000to25000cuttings/ha
24. Okra	-	7-8.5kg/ha
25. Bitter gourd	-	5-6kg/ha
26. Coleus	-	75-100 kg/tubers/ha
27. Snake gourd	-	3-4kg/ha
28. Cucumber	-	0.5-0.75kg/ha
29. Watermelon	-	1-1.5kg/ha
30. Bottle gourd	-	3-4kg/ha
31. Pumpkin	-	1-1.5kg/ha
32. Ash gourd	-	0.75-1kg/ha
33. Brinjal	-	370-500g/ha
34. Chilli	-	1kg/ha
35. Tomato	-	400g/ha
36. Cabbage	-	500-750g/ha
37. Cauliflower	-	600-750g/ha
38. Carrot	-	5-6kg/ha
39. Beetroot	-	7-8kg/ha
40. Radish	-	7-8kg/ha
41. Potato	-	1000-2000kg seed tuber/ha
42. Garlic	-	500kg of cloves/ha
43. Winged bean	-	15-20kg/ha
44. Cluster bean	-	10-12kg/ha
45. Clove bean	-	6-7kg/ha
46. Smooth gourd	-	2.5-3kg/ha
47. Ridge gourd	-	2.5-3kg/ha
48. Bell pepper	-	400-600g/ha

### **CONVERSION RATES BETWEEN RAW MATERIALS AND PROCESSED PRODUCTS**

Paddy	Rice	Cleaned 2/3 by weight of paddy
Groundnut	Kernels to nuts in shell	70 percent
	Oil to nuts in shell	28 percent
	Oil to Kernels crushed	40 percent
	Cake to Kernels crushed	60 percent
Sesamum	Oil to seeds crushed	40 percent

	Cake to seeds crushed	60 percent
Coconut	Copra to nuts	6,773 nuts gives one tone of copra (average), presently it is 7250-7500 nuts due to mite attack
	Cake to copra	38 percent
Pepper	Green to dry	21-39 percent by weight
Sugarcane	Gur from cane	10 percent
	Crystal sugar from gur	62.4 percent
	Crystal sugar from cane	9.9 percent
	Molasses from cane	3.5 percent
Cashew	Cashew Kernel	25 percent of nuts
Arecanut	Husked Champan to unhusked	35 percent by weight
Supari	(Processed tender nut to Unhusked champan)	12 percent
Tapioca	Starch	28-30 percent on the weight of fresh tubers
Turmeric	Cured to raw (Dry 17-25% of the raw stuff)	16-20 percent of the weight
Ginger	Dry Ginger	21-30 percent by weight
Cocoa	Pod to wet beans	40 percent by weight
	Wet beans to dried beans	35-40 percent by weight
Coffee	Robusta-Berried to clean coffee	4.5 to 3.6:1
	Wet beans to dried beans	5.0 to 3.3:1
Cardamom	Green to dry	25-35 percent
Oil Palm	Palm Oil	20% by weight of Bunch
Soyabean seed	Oil to soyabean seed crushed	18 percent
	Meal to soyabean seed crushed	73 percent
	Hull from soyabean seed crushed	8 percent
Neem seed	Oil to kernel crushed	45-50 percent
	Cake to kernel crushed	50-55 percent

## CONVERSION FACTORS FOR COCONUT

**A. Number of Coconuts to a tonne of Copra:**

Kerala	6,250 to 6,850 (at present it is 7250-7500 nuts due to mite attack)
--------	---------------------------------------------------------------------

Andrapradesh	8,820
--------------	-------

Tamilnadu	7,000
-----------	-------

Laccadives	12,000
------------	--------

**B. Copra yield from coconut in different months in Kerala at 6% moisture level/1000 nuts**

January	163kg
---------	-------

February	181kg
----------	-------

March	178kg
-------	-------

April	176kg
-------	-------

May	179kg
-----	-------

June	165kg
------	-------

July	152kg
------	-------

August	139kg
--------	-------

September	147kg
-----------	-------

October	148kg
---------	-------

November	155kg
----------	-------

December	158kg
----------	-------

**C. Nuts to shell, Coconut water etc.**

1000 nuts	114kg shell
-----------	-------------

1000 nuts	100 litres of coconut water
-----------	-----------------------------

1000 nuts	35kg of charcoal
-----------	------------------

**D. Coconut Oil from Copra**

Chekkus	58-60%
---------	--------

Rottories	62-63%
-----------	--------

Expellers	63-65%
-----------	--------

**E. Ball copra from coconut (per 1000 nuts)**

1.5tonne (grade 1)
--------------------

1.3tonne (average)
--------------------

**F. Dessicated coconut (per 1000 nuts)**

1 tonne of DC
---------------

**G. Cake yield as percentage of copra crushed**

Chekkus	38%
---------	-----

Rottories	36%
-----------	-----

Expellers	34%
-----------	-----

**H. Coconut to Fibre (per 1000 nuts)**

81.8kg – Kerala  
 68.3kg – Andhrapradesh  
 90.0kg – Tamilnadu  
 81.9kg – Karnataka  
 56.9kg - Others

**I. Composition of Coconut (Husked)**

Shell	27.9% (23.5 to32.8)
Kernel	55.2% (48.2 to 62.0)
Water	17.0% (8.2 to 25.1)

**J. Composition of Standard Copra**

Moisture	6%
Oil	68 to 71%
Free Fatty Acids	2%

Composition	Kernel	Copra%	Cake%
Moisture	46.3	5.8	10.7
Protein	4.1	8.9	19.1
Fat	37.3	67.0	11.1
Carbohydrates	7.9	12.4	40.9
Crude Fibre	3.4	4.1	14.1
Ash	1.0	1.8	4.1

**K. Fatty Acid Composition of Coconut Oil**

Saturated Fatty Acids	Un-Saturated Fatty Acids
Lauric Acid	Palmitoleic Acid
Caprylic Acid	Oleic Acid
Myristic Acid	Linoleic Acid
Straric Acid	Arachidonic Acid
Arachidic Acid	

**L. Coir pith per 10000 husk**

2 tonnes

**M. Charcoal yield from shell (per 3 tonnes of shell)**

1 tonne

**N. Processed coconut cream/1000 coconut**

200kg cream

**O. Coconut Vinegar (per 100 litres coconut water)**

110 litre vinegar

## PLANTATION CROPS

Plantation crops in general are either export oriented or import substituting and therefore assume special significance from the national point of view. It is estimated that nearly 14 lakh families are dependent on the plantation sector for livelihood. Each of the four plantation crops of South India its distinct characteristics and economics problems. Consequent to the removal of quantitative restrictions on import, plantation crops in general are facing the threat of low quality imports.

Kerala has a substantial share in the four plantation crops of rubber, tea, coffee and cardamom. These four crops together occupy 6.89 lakh ha, accounting for 31.58 percent of the net cropped area in the state and 43 percent of the area under these crops in the country. Kerala's share in the national production of rubber is 91 percent, cardamom 75 percents, coffee 22 percent during the year 2008-09.

### RUBBER

India is the fourth largest producer of natural rubber with a share of eight percent in the world after Thailand, Indonesia and Malaysia. The production of natural rubber in the country was 8.31 lakh MT in 2009-10, registering a 3.8 percent decline compared to the previous year. India is at the same time the second largest consumer of natural rubber after China. A 34 percent decline in the consumption of USA was recorded in 2009 over 2008 while consumption in China and India increased by 17.70 percent and 2.70 percent respectively.

Kerala accounts for 78 percent of the area under rubber in the country. The coverage under the crops in 2009-10 was 5.25 lakh ha, higher by 7933 ha over the previous year. The production of natural rubber in Kerala during the year was 7.45 lakh tones indicating a 4.85 percent decline over the previous year. The increasing trend in productivity continued during 2008-09. It was 1190 kg. per ha in 1998-99, which rose to 1514 kg during 2008-09. However it declined slightly to 1419 Kg/ha in 2009-10. In terms of tapping area, productivity recorded was 1867 kg. per ha during the year 2008-09 which declined to 1784 Kg/ha in 2009-10. Even though the domestic prices of natural rubber were more or less comparable to international prices during 2007-08, (Appendix 4.17) the industrial sector still resorts to imports in bulk quantities. The total quality imported was 86394 MT which slightly declined to 77616 MT in 2008-09. The import increased to 176756 MT in 2009-10.

The higher price in the international market is reflected in the domestic market also. The average of RSS 4 in the domestic market at Kottayam was Rs. 144.98 per kg. in 2009-10. The international price of RSS3, equivalent of RSS 4 of India, was Rs. 111.13 in the corresponding period. The price of RSS 4 in Kottayam reached Rs. 137.82 during August 2008 and then declined to Rs. 64.88 in October 2008 and further increased to Rs. 108.98 in October 2009 and Rs. 149.48 in March 2010. The Share of Rubber in Ernakulam is 12.92%.

## ANIMAL HUSBANDRY

The Animal Husbandry Sector plays an important role in strengthening the economy of the state, especially rural economy. It provides self employment opportunities to unemployed and underemployed rural poor. The majority of the live stock population in the state is concentrated in rural areas. The progress in livestock will directly reflect a more balanced development in rural economy and upliftment of weaker sections of the society. A large manpower is also involved in livestock eating and related activities. About 57% of world cattle population is in India. Animal husbandry activities play a crucial role in socio-economic transformation of rural areas especially in generating employment and income to the weaker sections of the population. The preservation and development of the cattle wealth and poultry are also significant to production of major livestock product of nutritional standard. Generally rearing of cattle and poultry farming are the allied occupations of agricultural workers. The animal power also constitutes the principle source of manure for agriculture. Animal Husbandry Department is vested with the animal health programme in the District by making available timely veterinary assistance and attends to the welfare of the animals in the District. Veterinary health care programmes are implemented through a network of institutions consisting of Veterinary, Polyclinics, and Veterinary Centres. The District Veterinary Centres are serving as referral centres. Mobile veterinary service is also offered from these centres. These centres and Veterinary Polyclinics at taluk level are fully equipped with diagnostic facilities.

The following Table shows the number of institutions functioning under Animal Husbandry Department in the District.

Animal Husbandry Department in the District as on 31.3.2001

Table: 16.1

<b>SI. No.</b>	<b>Institution</b>	<b>Nos.</b>

21	Veterinary Hospitals	23
22	Veterinary Polyclinics.	5
	<b>Total</b>	<b>208</b>

Animal Husbandry Department has launched a pilot programme to extend artificial insemination facilities to the doorstep farmers. Under the Intensive Cattle Development Programme there are 81 sub-centres, one artificial Insemination Centre and a Piggery Development Unit. There is also a mobile farm aid unit. The Regional Poultry Farm under the Intensive Poultry Development Block, Muvattupuzha is rendering good service to the needy public. A Regional Poultry Farm is functioning at Kuruppampady near Perumbavoor. The animal Husbandry Department in collaboration with United Insurance Company has formulated a Kamadhenu Insurance Scheme to insure the family of the farmers and their crossbred mulch cows.

The total Livestock Population in the District as per the XV Quasiquennial Livestock Census 1996 is as follows:

Table: 16.2

Sl. No.	Category	Nos.
(1)	(2)	(3)
<b>Livestock</b>		
1	Cattle	283459
2	Buffaloe	10173
3	Sheep	153
4	Goats	158399
5	Others	15316
	<b>Total</b>	<b>467500</b>

<b>Poultry</b>		
6	Fowls	1524869
7	Ducks	98011
8	Others	21498
9	Total	1944378

According to 1996 Livestock Census, the District had a total livestock population of 46700 which was 8.38 percent of the total livestock population of the state (5576917) while the poultry population (1944378) accounted for 7.22 percent of the total poultry population of the state (26946091). The District has only fourth position in the State in respect of livestock population according to 1996 Livestock Census. Regarding cattle population the District has the 2<sup>nd</sup> position with 283458 cattle, the first position being held by Palakkad with 363338 cattle. The livestock rearing is facing new challenges as a result of the fast changes that are taking place in the farm front replacing livestock friendly seasonal crops by perennial crops. Paddy based farming system and cattle rearing are inter dependent and as such the sharp decline in area under paddy cultivation has its impact on livestock rearing.

## FISHERIES

Fisheries form one of the most important sectors of Kerala's economy. Kerala is a coastal state and is bordered on the west by the marine flora and fauna rich Arabian Sea. The coastline of the state runs to a length of about 590km. The territorial limits of the state is about 22 kms from the sea shore and the total area covered by the sea that falls within this territory comes up to around 13,000 square kilometres. This is the area in which the marine fishermen of the state are allowed to venture. The shallow seabed surrounding the state of Kerala comes to around 3919 square kilometres. This is the most fertile region of the Arabian Sea as far as fisheries are concerned. The potential of the state in terms of marine fisheries is believed to be about 5.17 lakh tones. Not only do the fisheries contribute to about 3 percent of the economy of Kerala they also earn the state a great deal of foreign exchange and goodwill. The fisheries of the state are famous all over the world and are exported to Europe and America among other parts of the globe. At present the state of Kerala produces about 6 lakh tones of marine fishes every year.

Geographically, inland fisheries have great scope in the state. An inimitable feature of the state is the occurrence of 49 interconnected backwaters which have an area of 46129 ha. Besides there are estuaries, backwaters, brackish water area pokkali and prawn filtration fields and private shrimp farms. All these bodies of water provide rich sources of inland fish production.

Ernakulum District is one of the nine coastal districts of Kerala. It has coastal line of 46 Kms forming 7.8 percent of the total length of coast line in the state.

The sea along the entire coast of the District and the backwaters abound in fish of various kinds, offering enormous natural facilities for both marine and inland fisheries. Kochi is an ideal place to provide support to fisheries in its various aspects like education, research and development. Various important institutions are located here to serve this purpose like the Central Marine Fisheries Research institute, Natural and Engineering Training, Cochin, Base of the Exploratory Fisheries Project, Export Inspection Council of India, Integrated Fisheries Project, the Marine product and Export Development Authority, Naval Physical and Oceanographic Laboratory, Central Institute of Fisheries, Regional Centre of the National Institute of Oceanography (ICAR), Office of the Fisheries Advisor, Office of the Joint Director of

Fisheries, Kerala Fisheries Corporation, Regional Shrimp Hatchery, Department of Industrial Fisheries, Department of Marine Sciences Unit (University of Kochi), Fisheries Research Unit (Kerala Agricultural University) and the Sea Food Exporters Association of India.

The number of fishermen population in the District during 1999-2000 was 139,387, which comprised of 73,981 in marine and 64,406 in inland sectors. The District has only fourth position in respect of fishermen population in the State. The enormous increase in the number of crafts does not appear to have helped in boosting the marine fish production proportionately. On the other hand, the high presences of mechanized and motorized crafts have deprived the opportunities for thousands of traditional fishermen who solely depend on this sector for subsistence. In the District there were 4523 crafts in operation during 1999-2000. Of these 1327 were mechanized, 1129 were motorized and 2067 were non-motorised. The State has enacted the Kerala Marine Fishing Regulation Act with a view to enforcing a strict regulatory mechanism.

The species-wise composition of fish landing in Ernakulam District in the marine sector shows that the major landing during 1998 were the common varieties of fish such as Oil Sardine, Macherel, Prawns, Perches etc. The landing of Oild Sardine was 5016 tonnes in the District, which was 6.45 percent of the State landing (77795 tonnes). The landing of Mackerel (2300 tonnes) was 3.74 percent of the State landing (58575 tonnes). The fish landing contribution of the District was 60028 tonnes in 1998 i.e., 11.06 percent of the State landing (542696 tonnes). The landing of marine fish has shown a decrease of -34.77 percent during the period 1996-1998.

## WETLANDS

Wetlands play a vital role in maintaining the fragile environmental balance. Wetlands serve as sinks, sources and transformers of innumerable chemical, biological and genetic materials. They offer a unique habitat for a wide variety of flora and fauna as well. Wetlands are lands transitional between terrestrial and aquatic ecosystem where the water table is usually at or near the surface or the land is covered by shallow water. (Cowardin et al, 1979).

However the area under wetlands is fast declining across the world. Kerala, lying along the south west coast of India is blessed with a number of wetland ecosystems owing to its unique climatic regime and physiography. One of the wettest regions on earth with an average annual rainfall of 300 cm, the state of Kerala has around 6.5 lakh hectares under wetlands (Ministry of Environment and Forests, Government of India.). There has been large-scale degradation of wetlands with increasing human intervention and associated land use changes. There is an urgent need, therefore, to devise plans to prevent the degradation of wetlands, which is ever increasing with time. The significance of wetlands are manifold some of which are discussed below.

Wetlands serve as natural reservoirs of water and help enhance the ground water in the neighbouring areas. The wetlands support paddy, which is the source of rice, the staple food of Kerala. The wetlands spread over the coastal belts serve as a buffer preventing excessive intrusion of salt water. Hence there is an urgent need to devise plans to prevent the degradation of wetlands.

### **NATURAL WETLANDS OF ERNAKULAM – A PROFILE**

#### **The Vembanad Wetlands**

The physical spread of the Vembanad region extends to the low lying areas surrounding the Vembanad Lake, which form the deltaic plains of Pullot, Periyar, Muvattupuzha, Achencoil, Pamba, Manimala and Meenachil Rivers originating from the Western Ghats. The region lies between 91°5' – 90°35' N latitude and 76°23' – 76°35' E longitude. It covers an area of 870 km<sup>2</sup> comprising of about 490 km<sup>2</sup> of paddy fields, 300 km<sup>2</sup> of garden lands. The remaining areas consist of water bodies like lagoons, canals, and rivers. Nearly 60% of the area excluding the lake lie 0.5m to 2m below sea level and this area spread across Kuttanad. The entire region is half submerged in water during the monsoon season from June to January every year.

Bunds have been constructed to protect the low-lying areas from floods and tides. During high tide in dry season salt water incursion is a dominant phenomena noticed in the Vembanad ecosystem while fresh water inundation occurs during monsoon rains. This condition exists from centuries.

### **Other Wetlands**

Kodungallur kayal and Varapuzha kayal are two other backwaters adjoining the Vembmnad Lake. The Kodungallur kayal is found north of Parur taluk, and extends to the Thrissur district. The Varappuzha kayal lies south of the Parur taluk and the Periyar river drains into it.

### **PADDY - RESENT SCENARIO**

Paddy covers nearly ten percent of the total area of the district, while water bodies cover five percent of the total area. Other land use classes occupy 79 percent of the total geographical area of the district. Nearly 6 percent of land under paddy was converted to other land uses since the 1970s. This is a distressing reality, which needs careful evaluation. Wetlands serve a number of purposes including recharging the ground water of the neighbouring areas. With the conversion of wetlands to other land uses, water scarcity is expected to increase over the years. It should also be borne in the mind of any decision maker that if the present trend is not arrested, the wetland ecosystems will be degraded and the changes can never be reverted. Around 29977 hectares of land is under paddy cultivation within the district at present whereas during the 1970's paddy covered around 47328 hectares of land. The rate of conversion of paddy to other land use is around 37 percent over a period of 30 years. If this trend continues with 36 percent of paddy converted every 30 years, paddy cultivation will be non-existent before the turn of a century. The data pertaining to paddy at present and during the 1970's is provided in the table below (Table 4.1).

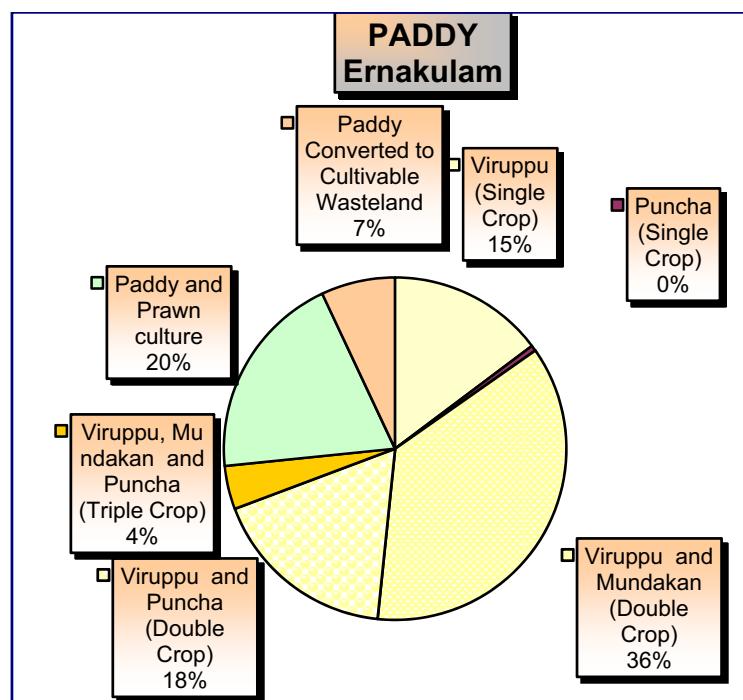

**Ernakulam – Area Under Paddy and Other Land Use**

Type	Area (in hectares)	Percentage
Total Area under Paddy	29977.28	10
Converted Paddy	17350.53	6
Total area under paddy during 1970's	47327.81	16
Other Land Use	243300.5	79
Water body	15250.36	5
Total District Area	305878.7	100

The conversion of paddy cannot be treated in isolation for the conversion will have detrimental effect on the environment and in turn on the human populations they support.

### PADDY CULTIVATION - ERNAKULAM

Paddy is cultivated as a single crop, double crop and triple crop within the district. However the area under double crop is more extensive amounting to 53 percent of the paddy cultivated areas whereas only a single crop is raised in 16 percent of the total paddy cultivated area. Of the total paddy fields, nearly seven percent of the land is left uncultivated. The pokkali system of rice cultivation (paddy and prawn culture) is carried out in 20 percent of the area. However the pokkali system of rice cultivation is being replaced by prawn cultivation alone in most parts because of the dwindling returns from paddy cultivation. The figure gives an idea about the percentage of area under various classes. Triple crop is raised only in 4 percent of the total paddy cultivated area. The puncha crop is raised in areas where the irrigation facilities are quite well developed

Among the double crops raised Virippu and Mundakan crops are raised in 10872 hectares, which is nearly double the area where the double crop Viruppu and

Puncha is raised (which is 5273 hectares). The table furnished below gives details on the area under single, double and triple crops. Single crop virippu is raised on 4410 hectares of land whereas triple crop is raised in 1228 hectares.

#### **Area Under Paddy - Ernakulam**

<b>Type</b>	<b>Area (in hectares)</b>	<b>Percentage Area</b>
Virippu (Single Crop)	4410.98	14.71
Puncha (Single Crop)	155.98	0.52
Viruppu and Mundakan (Double Crop)	10872.17	36.27
Viruppu and Puncha (Double Crop)	5273.13	17.59
Viruppu, Mundakan and Puncha (Triple Crop)	1228.47	4.10
Paddy and Prawn culture	5867.65	19.57
Paddy Converted to Cultivable Wasteland	2089.73	6.97
Mud flats	79.16	0.26
<b>Total Area under Paddy</b>	<b>29977.28</b>	<b>100</b>

#### **CONVERSION OF PADDY**

Around 17350 hectares, which were previously under paddy cultivation, has been converted to other land use over a period of thirty years. Majority of the paddy fields were converted for the cultivation of mixed crops (8163.50 hectares) and coconut plantations (3439 ha). The increasing population pressure has led to the conversion of paddy fields into built up land. Around 2505 hectares of land under paddy were converted into built up areas within the district.

### **Paddy Converted to Other Land Use**

Type	Area (in hectares)	Percentage
Paddy Converted to Areca nut	2.68	0.02
Paddy Converted to Banana	1056.54	6.09
Paddy Converted to Built-up land	2504.59	14.44
Paddy Converted to Coconut	3439.01	19.82
Paddy Converted to Eucalyptus	20.20	0.12
Paddy Converted to Mixed Crop	8163.50	47.05
Paddy Converted to Mixed Trees	259.35	1.49
Paddy Converted to Nutmeg	26.07	0.15
Paddy Converted to Rubber	1775.58	10.23
Paddy Converted to Tapioca	91.76	0.53
Paddy Converted to Teak	11.26	0.06
<b>Paddy Area Converted</b>	<b>17350.53</b>	<b>100</b>

Rubber is also grown on land, which were previously under paddy cultivation. The next major conversion of paddy was done for the cultivation of banana plantations, which occupy 1056.54 hectares. Details regarding the land use to which the paddy lands were converted are provided in the table above. 48 per cent of the paddy fields are being converted to mixed crops followed by coconut (20%), built up land (14 %), rubber (10%), and banana (6%).

## WASTELANDS

Land is one of the most important critical resources which determine the success of development planning of any region. Promoting optimum land use is an essential purpose in achieving the planned goals of economic efficiency and ecological activity. Identification of prime and unique lands for agriculture and prevention of its misuse, assume utmost importance for food, security and self-reliance. It is therefore imperative that for sustainable development, effort should be made to ensure that the available land in the state is put to wise and optimum use.

### **Wasteland defined**

Wasteland is defined as "degraded land which can be brought under vegetative cover with reasonable effort, and which is currently under utilized and land which is deteriorating for lack of appropriate water and soil management or on account of natural causes." Wastelands can result from inherent/imposed disabilities such as by location, environment, chemical and physical properties of the soil or financial or management constraints. These lands could fall under Government occupation, private occupation or forest lands. 13 categories of wasteland have been standardized and State and Central Government departments are using the same.

### **Wasteland classification**

The wasteland categories standardized by National Remote Sensing Centre, Hyderabad for Kerala for this proejt is as follows:

- 01 Land with dense scrub
- 02 Land with open scrub
- 03 Waterlogged - permanent
- 04 Waterlogged - seasonal
- 05 Scrub dominated forest
- 06 Degraded pastures/grazing land
- 07 Sands - riverine
- 08 Coastal sands
- 09 Mining wastelands
- 10 Barren rocky area

### **Data base**

Under wasteland mapping, four types of data are used. They are Satellite data, Topographic maps, Legacy data and Ground data.

## **Satellite data**

The IRS P6 LISS III geometrically corrected data with in the framework of NNRMS specified standards form the primary input for updating of wastelands. Multi – temporal data sets are used for the updation of wastelans in a pursuit to achieve improved classification accuracies. The geo-coded scene covers an area of 27 x 27 km covering approximately 729 sq. km.

## **Topographic maps**

Survey of India topographical maps on 1:50000scale in digital form will be used as a base layer for mapping and planning groundtruth collection. The digital topomap layer contains administrative boundaries (international, state, district, tehsil, village and forest management boundary), major roads, railway, drainage, settlements etc.

## **Legacy data**

The wasteland layer generated earlier using the 2003 remotesensing data will form the primary legacy layer. The other layers such as landuse/landcover and biodiversity data generated on different scales will be used as a reference while updating wasteland catogories.

## **Ground data**

Ground truth or ground investigation forms are important and integral part of the interpretation methodology of remotely sensed data. Ground data is attributed to collection, verification and measurement of information about the different surface features on earth, which are responsible for the occurrence of specific spectral reflectance behavioral patterns. Ground truth is dependent upon the extent of doubtful areas, the sampling procedure adopted during field traverses, the terrain conditions, classification accuracy requirements etc. However, good quality satellite data (more contrast and cloud free), interpretation skill/experience and knowledge of the study area can minimize ground truth collection.

## **Methodology**

The methodology is essentially digital interpretation of Multi – season IRS-P6 (LISS - III) geo-coded image (FCC) for identification of different categories of wasteland using standard visual image interpretation techniques which is based on interpretation elements such as tone, texture, shape, size, etc. supplemented by the local knowledge of the interpreter. Other ancillary data like topographical maps and any other available information will be used for identification and mapping of wastelands. The interpreted details are to be verified on the ground in order to rectify the doubtful areas, and based on the ground verification, the wasteland boundaries (interpreted details) are to be finalized.

## **Procedure**

Preparing the data is a primary requirement before undertaking image interpretation and subsequent analysis. Preparation of datasets involves the following steps.

### **Step 1 - Geo - rectification**

Satellite data which is available in a raster form need to be geo-referenced to a map coordinate system so as to generate spatial information to be used subsequently in a GIS environment. The process of geo-rectification involve assigning a coordinate system and transforming the raster image to input coordinate system which enables viewing, querying, and analyzing the geographic data. Images of different points of time are often acquired from sensors / platforms with varying geometry. Hence such images need to be referenced to a common projection system. The ETM + data which is available in UTM projection with wgs84 datum as a reference image is used for rectification of IRS LISS III 2005 - 2006 data using image to image registration algoritham.

### **Step 2 - Tile preparation for image interpretation**

In conformity with the National Spacial Frame work defined for NNRMS standards the entire state is devided to tile scheme (consisting of 15 minutes x 15 minutes) for interpretation, edge matching, quality assurance and final map preparation. For the ease of interpretation these tiles will be further devided in to grids of 5'x5'.

### **Step 3 - Image preparation**

Consistency in the image handling requires a thorough pre-processing of satellite data for inter and intra image alignments in terms of geometry and radiometry. Image data in Geo Tiff format may be imported using suitable format converters (National spatial framework projection parameter from NNRMS standards) and care to be taken to maintain the geo referencing scheme.

### **Step 4 - Image enhancements**

In order to improve the classification accuracy image enhancement methods are used. It is essential for improving the image contrast and allows the best possible delineation of wastelands by fine tuning the contrast.

### **Image interpretation**

Image interpretation is defined as “the art of examining the images for the purpose of identifying objects or surface features and judging their significance”. Interpretation key was prepared on the basis of image characteristics like tone, texture, shape, size, pattern, location and association that generally play a very important role for identification of various objects. Wasteland vector data of year 2003 is used as a template for updating the wasteland vector polygons by overlying it on to 2005-2006 satellite data.

## Analyzing wasteland dynamics

For analyzing wasteland dynamics, overlay operation is done in between Interpreted vector for current year (2005-2006) and the wasteland vectors for the year 2003.

### Ground data collection and verification

Ground truth / field verification is an important component in wasteland mapping and its validation exercise. It is very helpful in improving the classification accuracy of various wasteland categories.

### Computation of statistics

The district wise area statistics of different wasteland categories is generated. Out of the different categories of wasteland classified by National Remote Sensing Agency, the following seven categories have been identified in the district. The different categories identified and mapped in the State are as follows.

**Scrubland:** - This is a land which is generally prone to deterioration due to erosion. Such land occupies relatively high topographic locations. Scrublands are associated with moderate slopes in plains and foot hills and are generally surrounded by agricultural lands.

On the basis of presence of vegetation cover scrublands are classified into two sub-classes.

**1. Land with dense scrub:** - These areas possess shallow and skeletal soils, at times chemically degraded, extremes of slopes, severely eroded and land subjected to excessive aridity with scrub dominating the landscape. These are having a tendency for intermixing with cropped areas.

**2. Land with open scrub:** - This is a land which is generally prone to deterioration due to erosion and having no scrub cover. Such lands possess sparse vegetation or devoid of scrub and have a thin soil cover.

**3. Waterlogged / marshy land:** - Waterlogged land is that land where the water is at/or near the surface for the most part of the year. Marsh is a land, which gets permanently or periodically inundated by water and is characterized by hydrophytic vegetation, which includes water hyacinth and reeds.

Depending on the duration of water logging seasonality, two sub classes are delineated.

**a. Waterlogged – permanent :-** these are waterlogged areas where the waterlogging conditions prevail during most part of the year. These areas are mostly located in low-lying areas.

**b. Waterlogged – seasonal :-** seasonally waterlogged areas are those where the waterlogging condition prevail usually during the monsson period.these lands are mostly located in plain areas associated with the drainage congestion.

**4. Scrub dominated forest:** - Land, as notified under the Forest Act and those lands with various types of forest cover, in which vegetative cover is less than 20 per

cent are classified as degraded land. These areas are generally confined to the fringe areas of notified forests.

**5. Sand (coastal / desert / riverine):** - It refers to land with accumulation of sand, in coastal, riverine or inland areas. Mostly these lands are found in deserts, riverbeds and along the shores.

- a. **Sands – Riverine:** - Riverine sands are those that are accumulated in the flood plains as sheets, or sand bars. These include inland sand which was accumulated along the abandoned river courses or by reworking of sand deposits by wind action leading to long stretches of sand dunes or sand cover areas.
- b. **Coastal sands:** - These are the accumulation of sand that are seen as a strip along the seacoast due to action of seawater.

**6. Mining wastelands:** - Lands where mining operations bring about the deterioration of land are the mining wastelands. The industrial wastelands are lands which have deteriorated on account of large scale industrial effluent discharge.

**7. Barren rocky area:** - The rock exposures of varying lithology often barren and devoid of soil cover and vegetation. They occur amidst hill-forests as openings or as isolated exposures on plateau and plains. Barren rocky areas occur on steep isolated hillocks / hill slopes, crests, plateau and eroded plains associated with barren and exposed rocky / stony wastes, lateritic outcrops, mining and quarrying sites.

#### Brief description on spatial distribution and physical condition of wastelands

Area and percentage to total of each category of wasteland is given below.

Table: 19.1

Sl. No.	Wasteland Categories	Area in sq.km	% to total geographical area	% to total wastelands
1	Land with Dense Scrub	21.15	0.69	18.25
2	Land with Open Scrub	10.81	0.35	9.33
3	Waterlogged - Seasonal	3.42	0.11	2.95
4	Scrub dominated forest	52.03	1.70	44.90
5	Coastal Sands	1.42	0.05	1.22
6	Mining wastelands	11.93	0.39	10.30
7	Barren rocky area	15.13	0.49	13.06
<b>Total</b>		<b>115.88</b>	<b>3.78</b>	<b>100.00</b>

**1. Scrub dominated forest:-** :-This is the major category of the wasteland identified in the district. It covers a total area of 52.03 sq. km. representing 1.70 percent of the total geographical area and 45 percent of the total wasteland in the district. The forest includes notified forests, private forests and vested forests, of which only the notified forests possess territorial boundaries. The other categories do not have any demarcation in the ground as well as in the concerned toposheets. But the under-utilized or degraded forests identified in all the above forest lands are marked with appropriate symbol and accounted accordingly. This degraded forest area may or may not be within the notified

forest boundary as seen in Survey of India toposheets. Major area of this category of wastelands occur in Kuttampuzha Panchayath (2933.20 ha), Kavalangad Panchayath (39.37 ha), Mookkannur Panchayath (23.05 ha).

2. **Land with dense scrub :-** This is the next major category of wasteland mapped in the district. It represents 0.69 percent of the total geographical area and 18.25 percent of the total wastelands. This category of wastelands is distributed mainly in Ayyampuzha Panchayath (559.58 ha), Manjalloor Panchayath (190.78 ha), Kavalangad Panchayath (177.34 ha), Kalloorkkade Panchayath (103.80 ha).

### **Suggestions for reclamation of wastelands**

The major groups of wasteland mapped in the district are the Scrub dominated forest land and land with dense scrub. Both covers an area of about 73.18 sq. km. which represent more than 60 percent of the total wastelands in the district.

All the degraded forestlands are to be developed to hold perennial vegetative cover in order to check further deterioration and to make better use of the potentialities. Afforestation or greening of the degraded forestlands are to be taken with public participation. Catchments of reservoirs that are seen devoid of vegetation have to be compulsorily afforested with utmost importance for preventing soil loss from the slopes and to check silting up of the reservoirs. Suitable steps have to be initiated for afforestation of the degraded lands. Most of these wastelands are located at high altitudes. So suitable species for permanent vegetative cover are to be tried and introduced.

The measure to alleviate the waterlogging may be grouped into preventive and curative categories. The preventive measures aim at judicious utilization of water resources in such a way as to prevent building high ground water table. This can be achieved by lining of canals, adjustment of cropping pattern, irrigating the field with water which is sufficient enough for crop growth only thereby preventing loss of water which may contribute to ground water table and conjunctive use of surface and ground water resources. The main curative step is the establishment of surface drainage which transports the rain water as well as surplus irrigation water to the main stream. Another approach is to establish sub-surface drainage which lower the water table and simultaneously improves the physical condition of subsurface soils.

The wasteland coming under barren rocky/stony waste/sheet rock area hardly sustain plant growth due to lack of soil. Stony and gravelly lands lying extensively as wasteland to be closed to grazing for a few years to establish good vegetative cover before controlled grazing is permitted. The rocky, stony and hilly areas with skeletal soil not considered suitable for agriculture can be developed for recreation purposes.

## WATERSHED

Watershed development and management is an integration of technology within the natural boundary of a drainage area for optimum development of land, water and plant resources to meet the basic minimum needs of the people in a sustained manner. The poor in the rural areas who are struggling for survival cannot be expected to pay heed to the conservation strategy unless their daily needs of food, fiber and fuel are met with. A still more urgent need is for assured and full employment for all. Integrated watershed development and management is not only the most effective solutions to many of the problems mentioned above, but also effective solution to many other common problems like drought, floods etc. It includes the integration of many scattered programs of soil conservation, afforestation, minor irrigation, crop production, tree plantation, fodder development and other development activities into a well prepared micro watershed project based on study of climate, land, water & plant resources on the one hand and man, animal resources on the other, offers hope for bringing about sustained natural resources development. It also provides solution to many environmental problems like soil erosion, siltation, improper land use, lowering ground water table etc. Once these are solved the overall productivity, income of the family and employment opportunity in the villages could be increased and thereby the living conditions of the rural population can be enhanced.

The rain water after absorbed by the soil, flows as runoff in small gullies, rivulets and joins the stream and form river system. This represents a natural drainage system. The river basin at macro level and watershed /sub watershed at microlevel represent the Natural Drainage System.

A watershed is an area from which runoff, resulting from precipitation flows past a single point into a large stream, river, lake or an ocean. In other words a watershed is that area in which all the precipitation converges and drains past a particular point. The term watershed, catchment area of drainage basin can be used interchangeably. A watershed may be only a few hectares as in the case of small ponds, or hundreds of square kilometers as in the case of rivers or big reservoirs. For convenience watershed are classified in terms of size into: Basins, Catchments, Sub catchments, Watershed, Sub watershed, Mini & Micro watersheds. Each watershed is an independent hydrological unit; any modification of the land use in the watershed will be reflected on the water as well as in the sediment yield of the watershed.

The watershed can be demarcated from the topo sheet. But for a small (micro) watershed a detailed topographical survey has to be made and a contour map may have to be prepared. The ridge points are marked and the area below the ridge line is known as the watershed area. This contour map can be imposed with the village map. In case of small watershed, it could be demarcated by walking over the ridge point.

Watershed has become an acceptable unit of planning for optimum use and conservation of soil and water resources. A watershed is hydrological units which produce water as an end product by interaction of rainfall and watershed factor.

Table: 20.1

**WATER SHEDS**

## MINOR IRRIGATION

Kerala has a wide network of rivers and rivulets and springs spread over the entire cropped area. Minor Irrigation sector received considerable attention from Seventh Plan onwards and got a considerable boost during the Ninth Plan period consequent to the enhanced flow of funds from the grant in aid of the local bodies as well as special support received from the external agencies like European Economic Community, Dutch Government and assistance under RIDF of NABARD. With introduction of decentralized planning, all minor irrigation works (having cultivable command area up to 2000 ha.) were vested with the Panchayat Raj Institutions (PRIs). But by the enactment of new Act 'Kerala Irrigation and Water Management Act 2003' the definition of minor irrigation has been changed and works benefiting an area less than 15 ha. only come under the category of minor irrigation and are vested with PRIs. All other works having cultivable command area greater than 15ha. have been taken over by the Water Resources Department as medium irrigation. The major works implemented under surface water are minor irrigation Class-I, II and Lift irrigation schemes. Construction of check dam, Vented cross bars, weirs, tanks etc are the various works executed under minor irrigation Class-I & II.

The cumulative physical achievement of Minor irrigation up to Xth Five year plan was 235957 ha. (net). Minor irrigation has been given a considerable thrust during Eleventh Plan. About 24 per cent of the outlay in Irrigation sector is proposed for the development of Minor Irrigation. The details of physical achievement during the first two years of Eleventh Plan are shown in the table.

Table: 21.1

### **Physical Achievement of Minor Irrigation (Surface Water)**

**(Net area in Ha.)**

<b>Sl. No</b>	<b>Name of Schemes</b>	<b>2007-08</b>	<b>2008-09</b>
1	MI Class I	2217.00	1474.81
2	MI Class II	711.00	1522.93
3	Lift Irrigation works	712.00	173.75
4	Repairs to MI structure	40.00	0.00
5	MI Class I- NABARD	1802.00	2032.90
6	MI Class II- NABARD	1285.00	3015.90
7	Lift Irrigation- NABARD	53.00	88.62
	<b>Total</b>	<b>6820.00</b>	<b>8308.91</b>

The minor irrigation has always been a thrust area for NABARD not only in terms of providing increased refinance but also by introducing various developmental initiatives and financial incentives. The RIDF I, II and III have been closed on December 2002, RIDF IV by March 2005, RIDF V by June 2006 RIDF VI by September 2007, RIDF VII by December 2008. RIDF VIII by September 2008 and its reimbursement claim was closed by 31.12.2008. The RIDF X closed by December 2009 and its reimbursement claim by 31.03.2010.

## CHALAKKUDY IRRIGATION PROJECT

Chalakkudy project was taken up in two stages. The first stage consists of a diversion weir across Chalakkudy river at Thumburmuzhy. The second stage is an extension of canal systems executed during the first stage. There is no independent storage for Chalakkudy Irrigation system, but there are hydel reservoirs in the upper reaches. The source of water is the tailrace and surplus water from Peringalkuthu hydro electric scheme and the drainage water from the catchment of Chalakkudy river below the Peringalkuthu scheme. The Power houses of Kerala Sholayar and Peringalkuthu are operated at a pattern to suit the irrigation need of the basin. The weir is situated nearly 16 Km. east of Chalakkudy town.

### BASIC INFORMATION

District	-	Thrissur
<u>Ayacut area in Ha.</u>		
Achieved	-	Net 18530 Gross 37260
Potential	-	Net 19690 Gross 39380
River	-	Chalakudy
Benefited District	-	Thrissur
Year of Starting	-	1949 First stage
	-	1958 Second stage

### SALIENT FEATURES

#### I<sup>st</sup> Stage

##### (a) Weir

<u>Site</u>	Across the river Chalakkudy 11 miles east of Chalakkudy town. Latitude 10° 10' N Longitude 76° 26' 30" E nearest Railway Station – Chalakkudy (In Cochin Shornur Broad gauge line)
<u>Type</u>	Gravity type in mass concrete with coarse rubble casing.
<u>length</u>	185 m
<u>Maximum height of weir</u>	3.66 m
<u>Level</u>	
Average bed level	106.5 R.L
	Deepest foundation - 101.50
	Top of weir - 113.50

Discharge in river

Maximum - 115,000 cusecs.  
Minimum during crop - 613 cusecs.

Dry weather flow - 450 cusecs.

Nature of weir

Weir is of gravity type constructed mass concrete with coursed rubble casing.

(b) Head Work Regulators:Vents

14' X 5' with radial shutters, operated from platform above M.F.L. Water diverted through the regulator - 570 cusecs.

Nature of work

Foundation 1½" metal concrete in cement mortar.

Super structure

Rubble in cement mortar

Plat form

R.C.C. docking on R.S.J.

(c) Canal Systems:

New conversion from dry land	-	15,600 acres
Single crop land converted to		
Double crop land	-	7,600 acres
Existing double crop land	-	5,200 acres
Total	=	28,400 acres
		=====

Length

Main canals	-	56 Km
Branch Canals	-	162 Km
Discharge at head of main canal	-	285 cusecs

II<sup>nd</sup> Stage

The 2nd Stage contemplates only extension of the Channel System.

Length of Canal

Main Canal	-	27 km
Branch Canal	-	98 Km
Ayacut Served		
New Conversion	-	4050 acres
Single crop converted into		
Double crop lands	-	9450 acres
Existing double crop	-	6750 acres
Total	-	20250 acres
		=====

Crops

Paddy, Areca nut, Coconut, Vegetables.

## **MUVATTUPUZHA IRRIGATION PROJECT**

The Muvattupuzha Valley Irrigation Project (MVIP) envisages construction of earth cum masonry dam at Muttom (Malankara dam) across Thodupuzha a tributary of Muvattupuzha. It utilizes the tail race discharge of Idukki hydro electric project and the run off in the Thodupuzha river up to Malankara for irrigation of a total net cultivable command area of 17737 ha. The dam at Malankara across Thodupuzha River shall pick up the discharge and divert into two canal system on either sides of dam. Muvattupuzha river is formed by confluence of three tributaries namely. Todupuzha river, Kaliyar River and Kothamangalam river, all rising in the mountains of the Western Ghat. This project will benefit three districts viz, Ernakulam, Kottayam and Idukki. The dam site is about 27 Km from Muvattupuzha town and 8 Km from Thodupuzha town and is connected by all-weather road. The nearest main railway junction at Ernakulam is about 45 Km from Muvattupuzha. Location - Longitude Bet 76° 26' and 76° 40' south & Latitude Bet 9° 37' and 10° 4' North.

b) Height above deepest foundation (m)	Right	10.5
		6.00
		5.50

The estimates cost of the project as per 1980 Schedule of Rate was Rs. 4808 lakhs and the revised estimate of which is Rs. 793 crores based on 2008 schedule of rates. The expenditure as on March 2010 is Rs. 756.44 crores. The canal system consists of left bank main canal of 37.10 km length and right main canal of 28.337 Km of length and branches and distributaries of 57.154 and 241.014 Kms of length respectively. The work of dam, left bank main canal and Right Bank main Canals are completed and in respect of branches and distributaries it is completed for a total length of 43.544 Km, 159.19 Km respectively. The project was commissioned partly in November 2004, since when water distribution is being carried out in the completed stretches of canal. Project was initiated in 1974 for implementation with an original estimated cost of Rs. 20.86 crores. The escalation of expenditure till 2005-10

was 3516 percent. The project has to be closed during the eleventh plan itself considering the implementation of the project for more than decades. The cropping pattern in the Ayacut has changed and additional investment is required to irrigate the five crops.

## **PERIYAR VALLEY IRRIGATION PROJECT**

The River Periyar is the longest and largest among the 44 rivers in Kerala. The Periyar River originates from the Sivagiri group of hills in the forest and Sundra Malai at an elevation of +1830 mts. about 100 Km. south of Devikulam. Periyar Valley Irrigation Project is one of the medium Irrigation Projects in Kerala, situated in Ernakulam District and spread over the Ayacut area of Kothamangalam, Muvattupuzha, Kunnathunadu, Aluva and Paravoor Taluk. The Periyar barrage is at Bhoothathankettu in Kothamangalam Taluk at 1.5 Km. downstream of the affluence of the Idamalayar and Periyar. The Project envisages the utilisation of the controlled release from the Earthen dam constructed across Idamalayar one of the hydel schemes in the Muthirapuzha tributary of the Periyar. It is envisaged for various purposes such as irrigation, power generation, and salinity control, industrial and domestic uses. *Location- Latitude 10° 08' 16" North & Longitude 76° 40'00" East.*

b. Side Spans	:	44.67 m
ii. Top Level of Decking	:	
a. Central Spans	:	47.61 m
b. Side Spans	:	45.39 m
Water Spread area at FRL	:	1640 ha. or 16.40 Sq.Km.
Width of Road Bridge	:	6.78 m
Width of Hoisting Platform	:	3.66 m

**Head Regulator:-**

Site	:	At.ch.2100m of Main Canal
Sill Level	:	29.44 m
Full Supply of depth	:	5.51 m
Discharge	:	50.80 Cumecs
Top level of operating Platform	:	36.44 m.
Gross Command Area	:	1,14,352 ha.
Cultivable Command Area	:	36,500 ha.

**BRIDGE CUM REGULATOR AT KANAKKANKADAVU****PROJECT DETAILS**

This is a medium Irrigation Project at Kanakkankadavu across Chalakkudy river in Puthenvelikkara Panchayat in Ernakulam district. The main objective of the Project is to prevent intrusion of saline water to the upstream of the Chalakkudy river. About 2600 hectares of agricultural land in Poyya, Mala, Kuzhoor, Kunnumkara and Puthenvelikkara Panchayaths are protected from the threat of intrusion of saline water on construction of this bridge cum regulator. At present the prevention of saline water is made by temporary arrangements in every year constructing earthen bunds. Two temporary bunds are laid in every year, one at Kanakkankadavu and the other just downstream side of the proposed permanent structure in Chalakkudy river. These bunds are of purely temporary nature and will be washed off during flood season. On completion this regulator cum bridge has avoided yearly loss of expenditure for providing the temporary bunds and 2600 hectares of cultivable land can be protected from salinity.

By providing a deck, the structure will serve the purpose of a bridge across Chalakkudy river at about 20 Kms. downstream of Chalakkudy town. The bridge will help much for the development of that locality and act as a link road connecting the National Highway and coastal road. Hence the structure will serve these two purposes. The location of the structure is just at the upstream of the termination point of Chengamanad- Kanakkankadavu PWD road at Kanakkankadavu.

## Basic Information

District	Ernakulam
River	Chalakkudy
Ayacut area protected	2600 ha
Benefitted district	Ernakulam & Thrissur
Year of Starting	1984
Year of Commissioning	2000
Year of Completion	2002
Total Expenditure	Rs: 11.48 Crores
Officer in Charge	Executive Engineer, Irrigation Division, Ernakulam.

## Salient Features

### Structural Details.

Span between Abutments	83.36 m
No. of piers	9
No. of span including lock	11 each 6.08 m.
Length of impervious apron	
a) Upstream side	12 m
b) Downstream side	12 m
Benefitted area-	2600 ha
Maximum high tide level	+00.700 m
Maximum low tide level	-0.100 m (approx)
Shutter level	+1.000 m
MFL on 10.8.86	2.65 m
MFL during June 1985	3.200 m

### Other Utilities

The bridge and approach road is the shortest route from Aluva town to Mala in Trichur District by reducing about 10 kms

## 6. THERMAL IPPs

1	B.S.E.S Kerala Power Limited Kochi (IPP)	157.00	1099.00
2	KPC Kasargod (IPP)	20.44	140.00

## 7. WIND ENERGY (KSEB)

1	Wind Farm, Kanjikode	2.03	5.00
2	Ramakkalmedu (private sector)	10.50	20.24
3	Agali (private sector)	6.00	12.01

## MISCELLANEOUS

### **TRADE AND COMMERCE**

Ernakulam District has the place of honor on the commercial map of Kerala. It has won this unique position because of the location of the Cochin Harbour, 'the Queen of the Arabian Sea', in the District. The bulk of the sea borne trade of Kerala is carried on through the port of Cochin.

### **COCHIN EXPORT PROCESSING ZONE**

The Government of India has set up a separate zone for developing export oriented industries in the region. There are several units presently registered there. The items of export relate to scented oils, readymade garments, latex, gloves, electronic hardware, electronic software, food and agro products, etc.

### **RAILWAYS**

Railways play a significant role in the transport system of the District. Ernakulam is a major railhead of the Southern Railway. The Shornur- Cochin Harbour Terminus, Ernakulam- Thiruvananthapuram and Ernakulam- Alappuzha-Kayamkulam are the three broad-gauge railway tracks in the District. The length of broad-gauge railway track in the District is 53.94 kms. There are 6 railway stations in between Shornur and Cochin Harbour Terminus line and about 5 railway stations on the Ernakulam Junction- Thiruvananthapuram line within the District. Ernakulam Junction- Kayamkulam railway line has two railway stations within the District.

### **PORT**

The Cochin port known as 'the Queen of the Arabian Sea' is one of the major ports in India and it plays a very significant role in shaping the economy of the state. The port was planned, designed and constructed by the British Engineer Robert Bristow in 1920. The port is unique as it gives shipment facility even during the rainy season. Seventy five per cent of the total imports and exports of the State are carried out through this port. Super tankers meant for Kochi Refineries also call at this port. The principal commodities of export from this port are coir products, tea, rubber, coffee, cashew, kernels, chemicals, rice and other food grains, pepper, ginger, cardamom, turmeric, coconut oil, cashew shell liquid, lemon grass oil, timber, marine

products, oil cakes, machinery, iron and steel, mineral sand including granite and cement. The commodities which imported are rice, paddy, pulses, coal, machinery, iron and steel, tin plate, motor vehicles and spare parts, chemicals and chemical preparations, oil seeds including copra and ground nuts, drugs and medicines, paper, old newspaper and stationary, cotton (raw and waste), oil-man stores, provision and liquid sculpture, rock phosphate, fertilizers, liquid ammonia, salt, zinc concentrate, calcined bauxide, soda, candles, paraffin wax, cement etc.

The numbers of ships called at Cochin Port during year 2000-01 are 1100 as against 1096 in the year 1999-2000 and 858 during 1990-91. But the net registered tonnage decreased from 87.79 lakh tones during 1999-2000 to 82.17 lakh tones in the year 2000-01, an overall decrease of 6.41 per cent.

## AIRPORTS

Cochin is one of the four Airports in Kerala and regular Airport services are operated from Cochin to Delhi, Mumbai and Thiruvananthapuram. The Airport is under the control of the Defence Department of Government of India.

### COCHIN INTERNATIONAL AIRPORT LTD.

India's first Private Airport was opened in June 1999 at Nedumbassery. In June, 2000 it was raised to international level. Oman Airways started their operation from August 2001 and Silk Air started their operation from October 2001 are the major achievement of Cochin International Airport. During 1999-2000, 869 international flights were organized by Air India and 60 by Indian Airlines. Indian Airlines had operated 2367 domestic flights and 2101 domestic flights by Jet Airways. During 2000-01 the number of international flights operated by Air- India, Indian Airlines and Jet Airways mutually is 2454. The domestic flights have increased to 7874 during 2000-01 from 4468 during 1999-2000.
